Foreword

Photo: WIPO / Emmanuel Berrud

Welcome to the 17th edition of WIPO's flagship *Global Innovation Index (GII)*, our guide to the innovative performance of 133 countries, as well as the world's top 100 science and technology clusters. This year's special theme, *Unlocking the Promise of Social Entrepreneurship*, explores the link between innovation and social enterprises, and the impact this delivers for our world.

Looking at the global landscape in 2023, we find cloudy skies and gloomy weather. Following boom years between 2020 and 2022, R&D expenditures decelerated, the number of scientific publications fell, and venture capital investments returned to pre-pandemic levels, including in Africa and Latin America. If tighter financial conditions persist, this will hinder needed innovation investments in the near term.

Amidst these gray clouds and headwinds, we can see some rays of light. New innovation in Digital and Deep Science – highlighted in GII 2022 – continue to power progress, with significant developments in areas like genome sequencing, computer power, and electric batteries.

There are also improvements in what we term the socio-economic impact of innovation, with positive trends in key indicators, including a decline in global poverty and rises in labor productivity and life expectancy. In terms of rankings, we see that the top spots have remained quite stable. I think this reflects the fact that innovation ecosystems take time to build and those that already have strong foundations in place are reaping the benefits.

But we are seeing a continued trend of strong progress from emerging economies. Indonesia, Mauritius, Saudi Arabia, Qatar and Brazil have climbed the most in the GII over the past five years, with China, India, Iran, Morocco, the Philippines and Türkiye the highest risers over the past 10 years. A further 19 economies, primarily in Sub-Saharan Africa and Southeast Asia, are outperforming their development levels in innovation.

While these trends are promising, many of these innovation ecosystems still require careful nurturing. WIPO will continue to support countries at all stages of development to seize opportunities for entrepreneurship and innovation-driven growth.

The GII tends to be centered around innovation for economic growth and development. We have broadened our scope this year and chosen the theme of social innovation. Estimates suggest there are up to 11 million social enterprises and 30 million social entrepreneurs globally, contributing around USD 2 trillion to global GDP. Often these organizations are at the forefront of addressing critical issues like poverty, environmental sustainability, and social injustice.

Despite their undeniable impact, social enterprises have often been on the margins of traditional innovation models and policies. This 2024 GII edition brings the topic to center stage, highlighting the state of social entrepreneurship globally and offering policy recommendations to unlock the sector's innovation potential.

We hope that these insights, alongside the GII's wealth of data and analysis, serve as a powerful tool for pro-innovation policymaking globally and the continued development of strong, dynamic innovation ecosystems in all parts of the world.

Daren Tang
Director General
World Intellectual Property Organization (WIPO)

Acknowledgments

The *Global Innovation Index 2024* was prepared under the general direction of Daren Tang, Director General, in WIPO's IP and Innovation Ecosystems Sector led by Marco Alemán, Assistant Director General, and in the Department of Economics and Data Analytics led by Carsten Fink, Chief Economist.

The report and rankings are produced by a core team managed by Sacha Wunsch-Vincent, Head of Section, comprising Vanessa Behrens, Project Manager, Davide Bonaglia, Oriol Gisbert Martí, Anmol Kaur Grewal (all GII Fellows), Lorena Rivera León, Economist, and Jeff Slee, Data Scientist, from the WIPO Composite Indicator Research Section responsible for the GII, and William Becker, consultant in a personal capacity.

Soumitra Dutta (Oxford University and Portulans Institute), Bruno Lanvin (International Institute for Management Development, IMD and Portulans Institute), Lorena Rivera León (WIPO) and Sacha Wunsch-Vincent (WIPO) serve as co-editors of the GII.

The following WIPO colleagues provided substantive inputs to GII elaboration or dissemination: Kyle Bergquist, Ryan Lamb, Bruno Le Feuvre and Hao Zhou, all from the Statistics and Data Analytics Division, as well as colleagues from the External Relations Division, the Information and Digital Outreach Division, the IP and Innovation Ecosystems Sector, the Language Division, the News and Media Division, the Printing Plant, the Regional and National Development Sector, the WIPO Office in New York, and WIPO's External Offices.

A special thank you goes to our partners at the Portulans Institute; in particular, Rafael Escalona Reynoso, Mariam Chaduneli and Sylvie Antal for their contributions. We also thank the GII's Advisory Committee, the GII Industry Association Network, Academic Network and the GII Data Collaborators for their participation, as well as the Competence Centre on Composite Indicators and Scoreboards (COIN) team from the European Commission's Joint Research Centre – led by Michaela Saisana – that conducted the statistical audit. The report was edited by Richard Cook, Andy Platts and James Cooke at Book Now Ltd. The GII interactive data website was developed by Pere Rovira and Víctor Pascual at OneTandem.

We are grateful to the following individuals and institutions for collaborating with data requests, and without whom the Index would not be what it is:

Advisory Committee

Since 2011, the Advisory Committee has been guiding the strategic trajectory of the Global Innovation Index (GII). The Committee's purpose is to underscore the significance of innovation in both economic and social progress and to facilitate the dissemination of GII findings across every economy and region the world over. Consisting of a diverse array of international policymakers, thought leaders and corporate executives, members of the Advisory Committee are chosen from a variety of geographical and institutional contexts and make their contribution in an individual capacity. We extend our gratitude to all members of the Advisory Committee for their ongoing dedication and cooperation.

Advisory Committee members

Robert D. Atkinson

President, Information Technology and Innovation Foundation (ITIF), United States

Audrey Azoulay

Director-General, United Nations Educational, Scientific and Cultural Organization (UNESCO)

Doreen Bogdan-Martin

Secretary-General, International Telecommunication Union (ITU)

Tan Chorh Chuan

Permanent Secretary, National Research and Development, The National Research Foundation, Singapore

Philippe Varin

Coordinator, Brazilian Entrepreneurial Movement for Innovation (MEI), Brazilian National Confederation of Industry (CNI), Brazil

Industry Association Network

The Global Innovation Index Industry Association Network (GIIAN) is made up of well-established organizations representing a dynamic consortia of firms and private sector entities, all dedicated to advancing innovation. Building on 15 years of robust support from the GII's Corporate Network, this initiative has been rebranded as GIIAN in 2024. Currently comprising three associations, the number of network partners will be continually expanded over time. Companies in the Network lead in innovation and competitiveness across sectors, nations and regions, offering invaluable insights into the best ways of measuring and fostering innovation. They partner with WIPO to co-organize GII events and promote the GII's mission to enhance innovation measurement and growth.

Brazilian National Confederation of Industry (CNI)

Antonio Ricardo Alvarez Alban, President

Confederation of Indian Industry (CII)

Chandrajit Banerjee, Director General

International Chamber of Commerce (ICC)

Philippe Varin, Chair

Academic Network

Established in 2011, the GII Academic Network facilitates collaboration between leading global universities, their students and faculty members to conduct research and disseminate findings related to the Global Innovation Index (GII). Hosted by the Portulans Institute, this network currently comprises 12 institutions which play a crucial role in advancing academic discourse and knowledge exchange within the innovation domain. We express our sincere gratitude to all partners in the GII Academic Network for their invaluable contribution and support.

Brazil: University of São Paulo (USP), School of Economics, Management, Accounting and Actuarial Sciences; Moacir de Miranda Oliveira Júnior, Full Professor, Business Administration Department

China: Peking University, Office of Science and Technology Development; Weihao Yao, Director

Colombia: Universidad de los Andes, School of Management; Veneta Stefanova Andonova Zuleta, Associate Professor, and Carolina Dávila Aranda, International Office Director

Egypt: The American University in Cairo (AUC), School of Business; Sherif Kamel, Dean, and Nagla Rizk, Professor and Director, Access to Knowledge for Development Center

France: Institut Européen d'Administration des Affaires (INSEAD), Bruno Lanvin, Distinguished Fellow

Mexico: EGADE Business School at Tecnológico de Monterrey, Horacio Arredondo, Dean, and José Ernesto Amorós, Professor and Research Group Leader, Entrepreneurship & Innovation

Nigeria: Lagos Business School (LBS) Pan-Atlantic University, Chris Ogbechie, Dean, and Olayinka David-West, Associate Dean

Russian Federation: National Research University Higher School of Economics (HSE University), Institute for Statistical Studies and Economics of Knowledge; Leonid Gokhberg, First Vice-Rector and Director

South Africa: University of Johannesburg, College of Business and Economics, Erika Kraemer-Mbula, Professor of Economics

United Kingdom: University of Oxford, Saïd Business School, Soumitra Dutta, Dean

United States of America: Cornell SC Johnson College of Business, Ravi Kanbur, Professor, Charles H. Dyson School of Applied Economics and Management

Viet Nam: VinUniversity, Phan Thi Thuc Anh, Associate Vice Provost

The GII Partners

Preface

The goal of the Global Innovation Index (GII) is to be a holistic and flexible measure of the innovation happening all around the world today. To achieve this goal, the GII needs to go beyond capturing technological breakthroughs. It has also to account for the pioneering business models and social innovations driving positive change.

The 2024 edition of the GII focuses on social entrepreneurship, a model gaining prominence for its role in spearheading innovation aimed at addressing critical societal challenges. In recent years, an increasing cohort of entrepreneurs has embarked upon ventures that not only strive to achieve meaningful social impact, but also to be sustainable through market-based mechanisms. This innovative paradigm presents novel solutions in domains where traditional commercial enterprises have failed.

When executed aptly, social entrepreneurship promises shared value across communities and nations, facilitating the type of multidimensional value creation able to harmonize societal advancement with financial sustainability. Yet, despite its burgeoning significance, social entrepreneurship remains relatively unexplored within the traditional spheres of innovation research.

With this in mind, this 2024 edition of the GII sets out to provide an evidence-based foundation for advancing our understanding of social entrepreneurship as a significant driver of innovation. Rigorous research is now needed into how to cultivate an environment able to unleash the full innovation potential of social entrepreneurship. As co-editors of the GII, we remain committed to precise data and analytical rigor – principles with immense value that have been the cornerstone of the GII since its inception – and are proud to mobilize in order to cast additional light on the promising linkages between social entrepreneurship and innovation.

Developing comprehensive insights into the socioeconomic implications of social entrepreneurship empowers stakeholders to make informed decisions and implement strategic initiatives with a long-term impact, rather than resorting to sporadic actions yielding only anecdotal and short-lived effects. Within this context, the GII has a pivotal role to play as a catalyst for progress within both the public and private sectors. By objectively evaluating policies, initiatives, and the ecosystems that foster innovation, the GII can be instrumental in helping shape an informed landscape of global innovation practices, including social entrepreneurship.

Published annually by the World Intellectual Property Organization (WIPO), the GII has consolidated its position as the world's leading benchmark study of innovation. This authoritative report is enriched by valuable insights drawn from Academic Network partners across 13 countries that further contribute to the GII's status as the world's leading innovation study.

With steadfast support from the leadership at WIPO, including Director General Daren Tang and Assistant Director General Marco Alemán, the dedicated team behind the GII continues in its effort to advance the quantification of innovation's crucial role as an engine for sustainable and

inclusive development. It is our hope that the 2024 edition of the GII will prove to be a seminal contribution in highlighting the significant potential of social entrepreneurship as a powerful catalyst for innovation and for global good.

GII 2024 at a glance

The Global Innovation Index 2024 captures the innovation ecosystem performance of 133 economies and tracks the most recent global innovation trends.

Top three innovation economies by region

Latin America and the Caribbean

- 1 Brazil
- 2 Chile
- 3 Mexico

Sub-Saharan Africa*

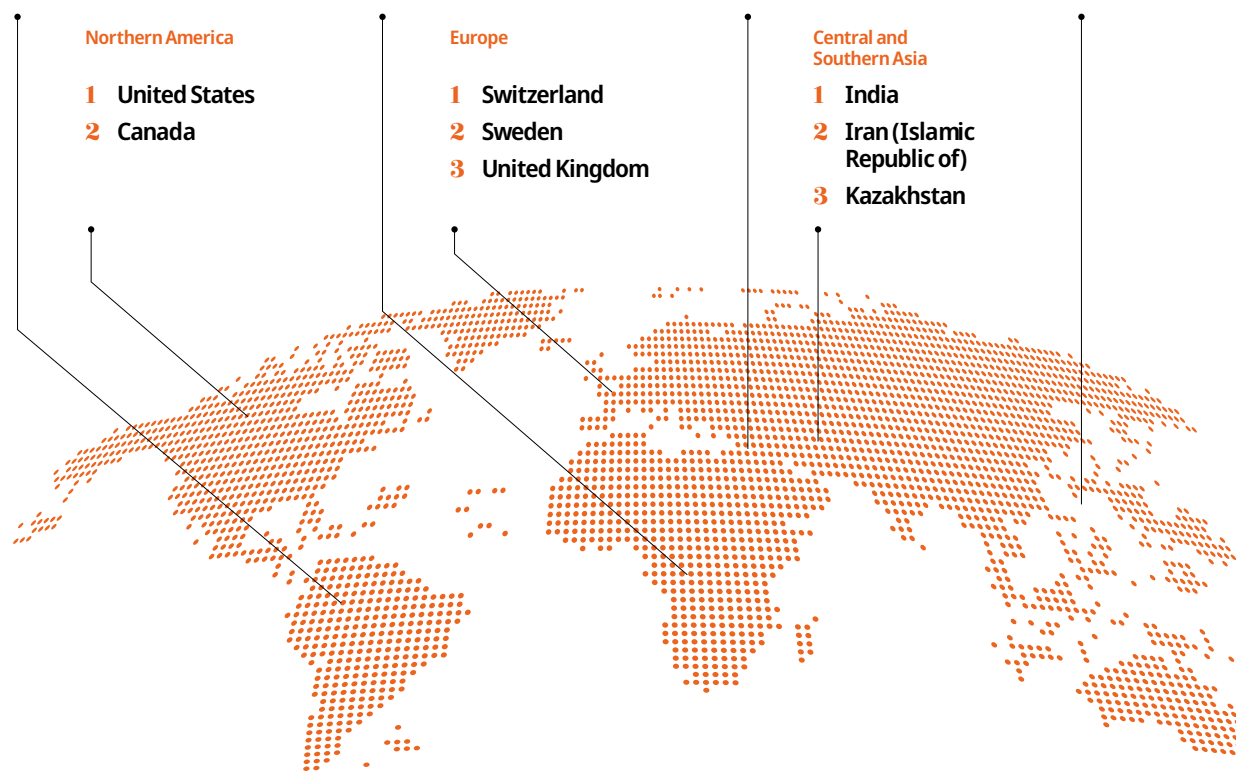

- 1 South Africa
- 2 Botswana
- 3 Senegal

Northern Africa and Western Asia†

- 1 Israel
- 2 United Arab Emirates
- 3 Türkiye

South East Asia, East Asia, and Oceania

- 1 Singapore
- 2 Republic of Korea
- 3 China

Top three innovation economies by income group

High-income

- 1 Switzerland
- 2 Sweden
- 3 United States

Upper middle-income

- 1 China
- 2 Malaysia
- 3 Türkiye ☆

Lower middle-income

- 1 India
- 2 Viet Nam
- 3 Philippines ☆

Low-income ^

- 1 Rwanda
- 2 Togo
- 3 Uganda ☆

☆ Indicates a new entrant into the top three in 2024.

* Top three in Sub-Saharan Africa (SSA) – excluding island economies. The top five in the region, including all economies, comprise Mauritius (1st), South Africa (2nd), Botswana (3rd), Cabo Verde (4th) and Senegal (5th).

† Top three in Northern Africa and Western Asia (NAWA) – excluding island economies. The top four in the region, including all economies, are as follows: Israel (1st), Cyprus (2nd), United Arab Emirates (3rd) and Türkiye (4th).

^ Top three in the Low-income group – excluding island economies. The top four in the low-income group, including all economies are as follows: Rwanda (1st), Madagascar (2nd), Togo (3rd) and Uganda (4th).

Notes: World Bank Income Group Classification (July 2023). Year-on-year changes in GII rank are influenced by performance and methodological considerations (see Appendix I).

Key takeaways

What is the current state of global innovation? Is innovation accelerating or slowing down? How is innovation coping in the face of higher interest rates and geopolitical conflicts?

Results of the Global Innovation Tracker 2024

The Global Innovation Tracker 2024 provides a comprehensive analysis of the current state of global innovation. Findings highlight progress as well as challenges across four key stages of the innovation cycle: science and innovation investment, technological progress, technology adoption, and the socioeconomic impact of innovation.

1. Innovation investments witnessed a major downturn in 2023, a reversal of the 2020–2022 boom

Following a boom between 2020 and 2022, science and innovation investment experienced a significant downturn in 2023 (see the Global Innovation Tracker Dashboard).

Global Innovation Tracker Dashboard

Science and innovation investment

Technological progress

Technology adoption

Socioeconomic impact

Notes: See the Data notes at the end of this section for a definition of the indicators and their data sources. Long-term annual growth refers to the compound annual growth rate (CAGR) over the indicated period. Historic data may have been updated and might differ from last year's Global Innovation Tracker. Figures are rounded. Estimates or incomplete data are indicated by an asterisk (*). n.a. indicates not available. Short-term rates for Moore's Law and the Cost of genome sequencing refer to the CAGR between 2021 and 2023.

Source: Global Innovation Index Database, WIPO, 2024.

- Scientific publications dropped by 5 percent in 2023, following growth rates above 8 percent annually in 2020 and 2021, and a slowdown in 2022.
- Global R&D grew at a rate of 5 percent in 2022 – slightly down from 2021 – but is projected to slow to about 3 percent in 2023 (all in real terms).
- Worldwide, R&D expenditure by the highest R&D-spending corporations grew by around 6 percent in real terms in 2023, below the long-term growth rate for the last 6 years (around 8 percent) and down strongly from peaks of 10 to 13 percent between 2019–2021, and also from pre-pandemic growth rates (all in real terms).
- Venture capital (VC) and scientific publications have declined sharply back to pre-pandemic levels, with a pronounced impact on emerging regions such as Latin America and Africa. Reflecting a deteriorating climate for risk finance, the value of VC investments has been falling from the exceptionally high levels of 2021, with a 36 percent drop in 2022 followed by a further 39 percent drop in 2023. The number of VC deals has also decreased, experiencing a downturn of 9.5 percent in 2023.
- International patent filings – which had stagnated since 2021 – saw a decline of 1.8 percent in 2023, marking the first such decline since 2009.

Looking forward, while some central banks have started cutting interest rates, tighter conditions for innovation finance might continue to weigh on innovation investment in the near term.

2. Technology continues to progress rapidly, technology adoption is growing, and the socioeconomic impact of innovation has mostly turned positive again. However, green technology and environmental indicators have either been progressing more slowly than before or have declined.

- **Technological progress** remained strong in 2023, particularly in health-related fields such as genome sequencing, as well as computing power and electric batteries. However, the rate of progress in green technologies lagged behind average growth for the decade, highlighting the challenge in reducing supercomputers' energy consumption and a slower reduction in renewable energy prices.
- **Technology adoption** increased across all indicators in 2023, especially in 5G, robotics, and electric vehicles. Overall penetration levels have increased compared to a decade ago, but there are exceptions, for example, the rate of adoption of safe sanitation has also significantly slowed.
- In terms of the **socioeconomic impact of innovation**, the situation is starting to look more positive again. Many indicators have returned to growth relative to what was reported in the 2023 GII edition, but some have yet to return to pre-pandemic levels.
 - Labor productivity has seen an increase, albeit at a rate below the average for the past decade.
 - Significant progress has been made in reducing poverty, with the number of people in extreme poverty in 2022 being half what it was in 2005. However, levels of poverty are still higher than those recorded in 2018.
 - Life expectancy saw a rise in 2022, but nonetheless remains at 2015 levels.
 - On environmental impact, though, the world is falling behind. Carbon emissions are growing once again after a temporary COVID-19 hiatus. 2023 was the hottest year on record, underlining the need for urgent and effective climate action.

Results of the Global Innovation Index 2024 rankings

3. Switzerland, Sweden, the United States, Singapore, and the United Kingdom lead the GII 2024; China, Türkiye, India, Viet Nam, the Philippines, Indonesia, the Islamic Republic of Iran and Morocco are the middle-income economies that have climbed the fastest in the GII ranking since 2013.

- Switzerland ranks first in the GII for the 14th consecutive year. Sweden and the United States (US) maintain 2nd and 3rd positions, respectively. Singapore (4th) moves further into the top 5, followed by the United Kingdom (UK) (5th).
- China – still the only middle-income economy within the GII top 30 – moves up the ranking to edge closer to the top 10, reaching 11th position.

- Japan remains firm in 13th – a position it has held since 2021.
- Canada rises up the rankings to 14th position, its best rank since 2014, and representing a comeback.
- Ireland (19th) and Luxembourg (20th) enter the top 20, climbing three ranks and one rank, respectively.
- Australia (23rd) and New Zealand (25th) continue moving ahead within and, respectively, towards the top 25.
- European Union (EU) economies the Czech Republic (30th) enters, and Cyprus (27th) and Spain (28th) move up within the top 30, while Poland (40th) enters the top 40.
- There are only four other middle-income economies, apart from China, among the top 40 economies, namely, Malaysia (33rd), Türkiye (37th), Bulgaria (38th), and India (39th). However, Thailand (41st) and Viet Nam (44th) move closer too.
- Brazil (50th) remains in the top 50 in 2024.
- Saudi Arabia (47th) and Qatar (49th) continue climbing up in the top 50; the two economies in the Middle East that have moved up the rankings this year.
- The Philippines (53rd) and Indonesia (54th) move closer to the top 50, with Indonesia making one of the strongest GII upward spurts recorded over the last three years.
- Morocco (66th) in Northern Africa and Western Asia moves ahead in the top 70.
- Beyond the top 100, Tajikistan (107th), Algeria (115th) and Burundi (127th) have progressed the most in the rankings.
- In the last five years, Indonesia, Mauritius (55th), Saudi Arabia, Qatar, Brazil and Pakistan (91st) have climbed most in the GII, in terms of rank progression.
- China, India, Indonesia, the Islamic Republic of Iran (64th), the Philippines, Türkiye, Viet Nam and Morocco are the middle-income economies within the GII top 70 that have climbed the most in the GII ranking since 2013.

4. Singapore, the United States and China score best in particular innovation indicators

- Singapore takes the lead in 2024 in terms of number of GII innovation indicators for which it ranks top globally, ranking 1st in the world on 14 out of 78 indicators.
- The United States (9 out of 78 indicators) and China (8 out of 78) follow.
- Select middle- and low-income economies excelled in various domains. Relative to GDP, trade or population, the Plurinational State of Bolivia, Cambodia and Nepal, for example, rank 1st in Loans from microfinance institutions, Malaysia in Graduates in science and engineering, and Mexico in Creative goods exports. Relatively, Morocco leads in Industrial designs, the Islamic Republic of Iran in Trademarks, and Namibia in Expenditure on education.

5. The regional GII leaders in innovation are Switzerland, the United States, Brazil, India, Singapore, Israel, and Mauritius; India and Rwanda continue to lead their income groups. Türkiye and the Philippines are newcomers to the top 3 for their income group.

- In the South East Asia, East Asia and Oceania (SEAO) regions, Singapore, the Republic of Korea (6th) and China (11th) lead. Four additional SEAO economies are world innovation leaders ranking in the top 25, namely, Japan (13th), Hong Kong, China (18th), Australia (23rd) and New Zealand (25th).
- In Northern Africa and Western Asia, Israel (15th) leads the region and is followed by Cyprus (27th), the United Arab Emirates (32nd) and Türkiye (37th). Eight economies within the region move up the ranking. Saudi Arabia (47th) and Qatar (49th) each move ahead one spot to consolidate themselves in the top 50. Georgia moves up to 57th place, entering the top 60, while Armenia (63rd) enters and Morocco (66th) consolidates its position in the top 70.
- In Latin America and the Caribbean, the regional top three remains unchanged: Brazil (50th) maintains top position, followed by Chile (51st, up by one rank) and Mexico (56th, up by two ranks).
- Seven additional economies within the region also improved their ranking: Colombia (61st) – one of the largest jumps in the region, matched only by Paraguay (93rd), Uruguay (62nd), Costa Rica (70th), Peru (75th), Panama (82nd) and Honduras (114th).
- In Central and Southern Asia, India continues to lead, moving one place forward to 39th position, the Islamic Republic of Iran (64th), Kazakhstan (78th) and Uzbekistan (83rd) come next. In addition to India and Kazakhstan, three additional economies within the region go up in the ranking: Sri Lanka (89th), Kyrgyzstan (99th) and Tajikistan (107th).

- In Sub-Saharan Africa, Mauritius (55th) is followed by South Africa (69th), Botswana (87th), Cabo Verde (90th) and Senegal (92nd). Kenya (96th) gains four places in the ranking, consolidating its position within the top 100. Zambia (116th), Benin (119th), Mauritania (126th), and Burundi (127th) also move up the GII ranking.
- In the GII 2024, Türkiye enters the top 3 for the upper middle-income group, behind China and Malaysia (33rd).
- India leads the lower middle-income group, followed by Viet Nam (44th) and the Philippines (53rd) – a newcomer to this income group's top 3.
- Rwanda (104th) leads the low-income group, followed by Madagascar (110th), Togo (117th) and Uganda (121st).

6. Several developing economies are performing above expectation on innovation relative to their level of economic development.

- In the GII 2024, 19 economies outperform on innovation relative to their level of development, the majority still located in Sub-Saharan Africa and South East Asia, East Asia, and Oceania.
- India, the Republic of Moldova (68th), and Viet Nam continue to lead as the longest-standing innovation overperformers, for a 14th consecutive year.
- Indonesia, Pakistan, and Uzbekistan maintain their overperformer status for a third consecutive year, and Brazil for a fourth.
- Conversely, 41 economies are performing below expectation on innovation, the majority from Latin America and the Caribbean and Sub-Saharan Africa.

Results of the global top 100 S&T cluster rankings

7. The world's five biggest science and technology clusters are all located in East Asia; Tokyo-Yokohama is the biggest S&T cluster globally, Cambridge the most S&T-intensive

- Tokyo-Yokohama (Japan) continues to lead, followed by Shenzhen-Hong Kong-Guangzhou (China and Hong Kong, China), Beijing (China), Seoul (Republic of Korea) and Shanghai-Suzhou (China).
- China, for a second consecutive year, leads with the most clusters (26) in the top 100. The United States follows, with 20 clusters, then Germany with eight.
- São Paulo (Brazil); newcomer Cairo (Egypt); Bengaluru, Delhi, Chennai and Mumbai (India); Tehran (Islamic Republic of Iran); Kuala Lumpur and Singapore; Istanbul and Ankara (Türkiye); and Moscow (Russian Federation) are the only middle-income economy clusters outside of China.
- Cambridge in the United Kingdom and San Jose-San Francisco, CA, in the United States are the two most S&T-intensive clusters relative to population density. Eindhoven (Kingdom of the Netherlands), Oxford (United Kingdom) and Boston-Cambridge, MA (United States) follow. In the Republic of Korea, Daejeon ranks the seventh most S&T-intensive cluster and is the only Asian cluster in the top 10 by intensity. Munich (Germany) maintains its rank as the 10th most S&T-intensive cluster globally.
- The GII 2024 identifies the top African S&T clusters within Africa beyond the global top 100. Egypt has the most clusters (11), followed by South Africa (8), Morocco (5), Nigeria (4), Tunisia (4), Ethiopia (2), Ghana (2) and Kenya (1), with others following. These clusters are strong in scientific publications but weaker in international patenting, thus they continue to be more science rather than full-blown S&T clusters.

Top S&T cluster by economy or cross-boarder region ranked among the top 100, 2024

Note: Circles with dotted borders indicate the number of total clusters in that economy, for economies with three or more top 100 S&T clusters.

Results of the Special theme - Unlocking the promise of social entrepreneurship

8. This year's special GII theme looks to the future of social entrepreneurship and asks: What will it take for social entrepreneurship to catalyze transformative innovation and societal impact?

- The special theme "Unlocking the promise of social entrepreneurship" emphasizes the rise and significance of social entrepreneurship as a global phenomenon aimed at addressing critical social and environmental issues through innovative business models. Social entrepreneurs aim to develop and fund solutions that address societal challenges while generating revenue within the confines of a market economy.
- This approach has gained momentum among young inventors and innovators seeking to align their work with positive social change, especially in areas overlooked by traditional businesses and governments.

- Current estimates suggest there are between 10 and 11 million social enterprises and up to 30 million social entrepreneurs globally, contributing roughly USD 2 trillion to global GDP.
- Social enterprises tackle various issues that include poverty, environmental sustainability and social injustice. For instance, Bandhu Tech in India provides housing for migrant workers using an AI-enhanced platform; Green Bio Energy in Uganda produces eco-friendly briquettes; Peek Vision offers mobile eye-health services in low-resource settings; Thaki refurbishes laptops for refugee education; and in India the Community Design Agency involves low-income communities in housing projects.
- Despite their impact made by these enterprises, traditional innovation models and policies have largely ignored such community-based ventures.
- Social entrepreneurship operates within diverse definitions and legal frameworks, reflecting the regional histories and policy environments in which they exist. These enterprises often face competing demands between social impact and financial success, beneficiaries and investors, and long-term systemic change versus short-term survival. However, such tensions also serve to drive their innovation potential, by combining aspects of the social sector and the market.
- Social enterprises create impact through various pathways, including customer-focused models that provide essential services to underserved populations, employee-focused models that hire and train marginalized individuals, product/service-focused models that develop sustainable products, and ecosystem-focused models that mobilize diverse stakeholders in order to effect systemic change. Examples include SOIL in Haiti, which provides sanitation services; iKure in India, offering primary health care through a hub-and-spoke model; Eco Femme in India, producing reusable menstrual pads; and WeRobotics in Switzerland, which connects local drone and AI experts with global organizations.
- Innovation in social entrepreneurship often involves process and product innovations tailored to fit local contexts, emphasizing collaboration and open-source strategies. Intellectual property (IP) activity varies, with some enterprises securing patents and trademarks.
- The report identifies several barriers to social entrepreneurship, including limited legal frameworks, financing challenges, and inadequate impact measurement.
- Policy recommendations include developing supportive legal and regulatory environments, investing in education and training programs, promoting data collection, assisting social entrepreneurs in reaching underserved communities, incubating social enterprise networks, and creating incentives for private investment. Public and private sector collaboration is crucial for addressing these barriers and unlocking the full potential of social entrepreneurship.
- At the same time, the onus for action and change is not only on the actors that surround social entrepreneurs. There is also scope for social entrepreneurs themselves to more actively drive innovation in their ventures. To some extent, this is a matter of social entrepreneurs recognizing the critical role that innovation plays and directing their attention toward key activities such as R&D, process innovation, and patenting and trademarking. But it also involves social entrepreneurs taking concrete actions to embed their enterprises in existing innovation ecosystems. They can do this, by tapping existing sources of scientific and technological knowledge, as well as venture capital, R&D tax credits, and other innovation finance tools, and by collaborating with universities, public research organizations and other entrepreneurs.
- Ultimately, social entrepreneurship offers a transformative approach to tackling global challenges, by merging business innovation with social goals. By investing in supportive policies, infrastructure and financing, it is possible to create an environment where social enterprises thrive, driving sustainable development and creating lasting positive impacts on a global scale.
- Innovation policy needs to be better designed to support social entrepreneurship, which requires a focus on institutional frameworks, human capital, infrastructure, networks, financing, and measurement. The 2024 edition of the GII addresses these gaps by highlighting the state of social entrepreneurship globally and the role of innovation in creating positive impacts, and offers policy recommendations for unlocking the sector's potential.

Global Innovation Tracker

What is the current state of innovation? How rapidly is technology progressing and being embraced? What are the resulting societal impacts?

Science and innovation investment

	Scientific publications	R&D investments		Venture capital	International patent filings	
		Global total	Top corporate R&D spenders	Deal numbers	Deal values	
Short term	-5.3% 2022 → 2023	5% 2021 → 2022 2.9%* 2022 → 2023	6.1%* 2022 → 2023	-9.5% 2022 → 2023	-39.7% 2022 → 2023	-1.8% 2022 → 2023

Short term	60.0% 2021 → 2023	13.6% 2022 → 2023	-3.9% 2021 → 2022	-3.5% 2021 → 2022	-13.7% 2022 → 2023	-8.1%* 2021 → 2023	9.5% 2022 → 2023
Long term (annual growth)	42.3% 2013 → 2023	30.6% 2013 → 2023	-15.0% 2012 → 2022	-9.1% 2012 → 2022	-15.8% 2013 → 2023	-20.1%* 2013 → 2023	3.7% 2013 → 2023

Technology adoption

	Safe sanitation	Connectivity		Robots	Electric vehicles	Cancer radiotherapy
		Fixed broadband	5G			
Short term	1.4% 2021 → 2022	4.5% 2022 → 2023	22.6% 2022 → 2023	12.2% 2021 → 2022	53.8% 2022 → 2023	2.7% 2022 → 2023
Long term (annual growth)	2.4% 2012 → 2022	6.7% 2013 → 2023	45.3% 2021 → 2023	12.2% 2012 → 2022	58.9% 2013 → 2023	1.6% 2013 → 2023
Penetration	57 of 100 inhabitants in 2022 (45 in 2012)	19 per 100 inhabitants in 2023 (10 in 2013)	38% of global population in 2023 (18% in 2021)	n.a.	3 out of 100 cars in 2023 (0.04 in 2013)	21 out of 100 countries met requirements in 2023

Socioeconomic impact

	Labor productivity	Poverty	Life expectancy	Global warming
Short term	1% 2022 → 2023	-5% 2020 → 2021	0.9% 2020 → 2021	+1.17°C 2023
Long term (annual growth)	2.2% 2013 → 2023	-2.7% 2012 → 2022	0.1% 2012 → 2022	+0.68°C 2013
Level	USD 51,450 in 2023 (43,260 in 2013)	712 million in 2022 (934 in 2012)	72 years in 2022 (71 in 2012)	n.a.

Notes: See the Data notes at the end of this section for a definition of the indicators and their data sources. Long-term annual growth refers to the compound annual growth rate(CAGR) over the indicated period. Historic data may have been updated and might differ from last year's Global Innovation Tracker. Figures are rounded. Estimates or incomplete data are indicated by an asterisk (*). n.a. indicates not available. Short-term rates for Moore's Law and the Cost of genome sequencing refer to the CAGR between 2021 and 2023.

What is the current state of global innovation? Is innovation accelerating or slowing down? How is innovation coping in the face of higher interest rates and geopolitical conflicts?

The Global Innovation Tracker 2024 addresses these crucial questions. It takes the pulse of four key stages in the innovation cycle: (1) science and innovation investment; (2) technological progress; (3) technology adoption; and (4) the socioeconomic impact of innovation. The main findings are as follows:

1. **Science and innovation investment:** Following a boom between 2020 and 2022, investment in science and innovation experienced a significant downturn in 2023, marking a notable reversal from previous years. Venture capital and scientific publications declined sharply back to pre-pandemic levels, the impact being most pronounced in emerging regions such as Latin America and Africa. Corporate R&D spending also slowed, mirroring stagnant revenue growth and resembling the post-2009 crisis deceleration. Despite high R&D levels and stable intensities, international patenting has decreased. Looking forward, while some central banks have started cut interest rates, the tighter conditions for innovation finance, might continue to weigh negatively on innovation investments in the near term. The outlook for 2024 and 2025 is unusually uncertain.
2. **Technological progress:** Technological advancements remained strong in 2023, particularly in health-related fields such as genome sequencing, as well as computing power and electric batteries. However, progress in green technologies lagged behind average growth for the decade, highlighting the difficulty in reducing the energy consumed by supercomputers and a slower than previously common declines in renewable energy prices'.
3. **Technology adoption:** The adoption of technology saw positive growth across all indicators in 2023, especially in 5G, robotics, and electric vehicles. While overall penetration levels increased compared to a decade earlier, there are exceptions, such as the slower penetration rate of cancer radiotherapy equipment. The adoption of safe sanitation has also slowed significantly.
4. **Socioeconomic impact:** Many socioeconomic indicators have returned to positive growth, representing a return to normalcy post-COVID-19. However, several metrics, such as poverty rates and life expectancy, have not yet returned to pre-pandemic levels. Productivity has increased but still lags, in terms of overcoming the structural slowdown identified in the Special theme of the GII 2022 – the effective deployment of a new Digital Age and a Deep Science innovation wave is still work in progress, it would seem. Environmental impact indicators, including carbon emissions and global temperatures, continue to rise, underscoring the need for further action to combat climate change. Technological innovation plays a crucial role in addressing environmental challenges; yet, it is clear that technology is only one part of the solution.

Science and innovation investment

Innovation investment remained resilient throughout the 2020–2021 COVID-19 period and the associated downturn. Indeed, many innovation investment variables – including scientific publications, R&D and venture capital – boomed. However, the first signs of weakness in innovation investment appeared in 2022, although returning from a historic high. This slowdown intensified in 2023, making the outlook for 2024 and 2025 uncertain.

Scientific publications

The scientific landscape experienced a significant shift, a 5 percent decrease in publications between 2022 and 2023 deviating from the decade-long average increase of around 4 percent.

However, this represents nothing other than a return to the pre-pandemic growth trend (Figure 1). Indeed, the period between 2019 and 2021, just prior to and during the COVID-19 pandemic, witnessed an acceleration in new publications, with exceptional growth in 2020 (8.7 percent) and 2021 (8.4 percent). This period was followed by a deceleration in 2022 (3.4 percent), linked to a decrease in research output in environmental sciences and COVID-19-related fields. Yet, despite this decline, the number of publications in 2023 remained above the 2013–2019 trend.

Figure 1 Number of scientific publications (millions), 2013–2023

Research and development (R&D)

Total R&D expenditure

The most recently available data show that global R&D investment growth in 2022 slowed to 5 percent (in real terms). This is down from 6.6 percent in 2021,¹ and slightly below the pre-pandemic growth rate of 6.2 percent in 2019. The growth of business R&D expenditure – the most significant component of total global R&D, representing 70 percent of total global R&D – likewise slowed to 6 percent in 2022 (compared to 8.5 percent growth in 2021), yet is still comparable to the pre-pandemic rate of 6.6 percent in 2019 (Figure 2).²

Estimates for 2023, based on projected GDP growth, paint a potentially unhappier scenario, with global R&D growth expected to slow again to less than 3 percent in 2023, and business R&D to 2.8 percent (1.7 percent and 1.4 percent, respectively, excluding the United States and China).³ If estimates prove correct, these would be the lowest growth rates on record since 2010. Moreover, this would mean that the growth rate for business R&D growth would be at the same level as the growth rate for total gross domestic R&D expenditure (business plus private); a situation that has been observed before, but never at such comparatively low rates (see Figure 2).

- 1 Estimates of growth in 2021 were also revised up to 6.6 percent, compared to 5.2 percent reported in the GII 2023, as several economies subsequently reported more complete and up-to-date estimates.
- 2 The top 5 economies in R&D spending all saw growth in 2022, though it was slower than in 2021 for most, except for Japan and the Republic of Korea. The United States spent 4.9 percent (down from 7.7 percent), China 7.7 percent (down from 9.6 percent), Japan 4.9 percent (up from 2.9 percent), Germany 1.9 percent (down from 3 percent), and the Republic of Korea 8.9 percent (up from 6.8 percent).
- 3 The OECD has found similar slowdown scenarios for 2023 for the OECD area (OECD, 2024).

Figure 2 GDP growth and total and business R&D growth rates, 2007–2025

Source: WIPO estimates, based on the UNESCO Institute for Statistics database, Organisation for Economic Co-operation and Development (OECD) Main Science and Technology Indicators (March 2024); Eurostat; Ibero-American and Inter-American Network of Science and Technology Indicators (RICYT); and the International Monetary Fund World Economic Outlook Update, April 2024.

Top corporate R&D spenders

On the corporate side, 2023–2024 R&D data is available for around 1,700 of the top 2,500 biggest corporate R&D spenders globally (Nindl *et al.*, 2023).⁴ In 2023, corporate R&D expenditure stood at around USD 1.2 trillion, up by around 8.3 percent in nominal terms and around 6.1 percent in real terms⁵ – these figures, derived from the weighted averages of national growth rates, represent a decline from the 2022 real growth of 7.5 percent and a decline from the long-term real growth rate.

Compared to the pre-pandemic 2019 and pandemic period, there has been up to a halving of real top corporate R&D growth in 2020 and 2021 (see Table 1).

Interestingly, however, R&D intensity – that is, R&D expenditure as a percentage of total revenue of the top corporate R&D spenders, has remained constant.

4 It is important to acknowledge that the data presented focuses on top R&D performers, often referred to as “R&D superfirmers.” A comprehensive evaluation of corporate R&D performance for 2023 would require additional data, including information from small and medium-sized enterprises that may have found obtaining innovation finance challenging in an environment where R&D is becoming both costlier and riskier.

5 Converting the R&D figures to constant 2015 PPP prices helps to isolate the changes in R&D spending by eliminating the effects of price fluctuations and exchange rate variations, assuming all other conditions remain constant. Setting the PPP constant to a specific year, such as 2015, indicates the amount of R&D that one could purchase for 1 USD in the US in 2015.

Table 1 R&D growth rates of top global corporate R&D spenders, 2019–2023

Year	R&D			
	Nominal (billion USD)	Weighted nominal growth (%)	Weighted real growth (%)	Weighted R&D intensity (%)
2019	894	10.5	10.4	5.6
2020	982	12.7	10.7	6.0
2021	1,089	15.2	12.8	5.7
2022	1,174	8.8	7.5	5.8
2023	1,243	8.3	6.1	5.7

Notes: Real growth refers to the growth of variables in USD PPP 2015. R&D intensity refers to the ratio of the level of real R&D PPP 2015 expenditure to real revenue PPP 2015.

Source: WIPO, based on Bureau van Dijk (BvD) Orbis database.

In terms of unweighted nominal growth (Figure 3), the ICT hardware and electrical equipment, and the software and ICT services sector, saw their growth rates divided by two between 2022 and 2023. In contrast, the pharmaceutical sector experienced a significant rebound in R&D expenditure, with growth increasing more than threefold, from 3 percent in 2022 to 10 percent in 2023. In 2023, the pharmaceutical sector led in R&D intensity at 19 percent, followed by Software and ICT services with 14 percent.

Figure 3a Nominal R&D expenditure of top R&D spenders by industry and year, 2019–2023

Source: WIPO, based on Bureau van Dijk (BvD) Orbis database.

Figure 3b Intensity of top R&D spenders by industry and year, 2019–2023

Source: WIPO, based on Bureau van Dijk (BvD) Orbis database.

Figure 4 shows the nominal percentage change in R&D expenditure for 2023 among the top 15 firms in the top seven industries. In 2023, most of the top 15 R&D spenders across various industries increased investment, continuing a positive trend. However, 25 firms did the opposite and reduced investment.

Notably, four of the top R&D investors in ICT hardware reduced expenditure, in contrast to the year before, when all ICT top R&D investors increased R&D expenditure. In software, two firms decreased spending, while in pharmaceuticals, four firms did so. A few highlights:

- In the ICT hardware sector, a slowdown was evident, with Nvidia's R&D growth rate decelerating from around 35 percent in 2022 to 18 percent in 2023.
- Meta's and Uber's R&D – which jointly recorded the highest growth rate last year at 30 percent – fell substantially to around 10 and 13 percentage points, respectively.
- In contrast, the pharmaceuticals sector experienced an accelerated growth, with Eli Lilly, Novartis, and Merck US all recording an R&D growth rate exceeding 20 percent.
- The automotive industry reported a substantial rise in R&D expenditure, particularly by Tesla (by around 30 percent).

Venture capital

After experiencing extraordinary growth in 2021, with a 47 percent increase in the number of deals and a 127 percent increase in deal value reminiscent of the pre-dotcom bubble era, the venture capital (VC) landscape faced significant challenges in 2022. Tighter monetary conditions led to a sharp reduction in VC fund inflows, with a 36 percent drop in deal value, even though the number of deals competed continued to rise by 22 percent.

This trend continued into 2023. The number of VC deals fell by around 10 percent (see Dashboard), while the total amount of money invested in VC dropped further, by around 40 percent (Figure 5).

In 2023, Africa experienced the steepest decline in VC deals seen at the regional level, dropping by around 25 percent from 471 to 349. Africa was followed by the Asia-Pacific region, which saw an almost 20 percent decrease, from approximately 9,600 deals down to 7,700. Northern America, although still leading with around 9,000 deals, experienced a 7 percent decline from the 9,600 recorded in 2022. Latin America also saw a decrease, with deals falling by 7 percent, from 539 to 500. Interestingly, Europe bucked the trend, with the number of deals increasing by 7 percent, reaching a historic record of approximately 5,400 deals.

The total amount invested in VC dropped significantly, from USD 595 billion in 2021 to USD 379 billion in 2022, and dropped further to USD 228 billion in 2023. This decline is reminiscent of the financial crisis of 2009. Tighter monetary policy is driver behind this slowdown.

The Latin America region experienced the steepest decline in VC value, plummeting by 67 percent. This was followed by Northern America, with a 40 percent decrease, Europe at 38 percent, Asia-Pacific at 38 percent, and Africa with the smallest decline at 30 percent. Despite a steep fall in the number of deals, Africa's VC values remained relatively robust in 2023.

A long-term perspective reveals significant structural changes within the geographical distribution of VC investment (Figure 6). In 1997, the United States and Canada concentrated 86 percent of VC values, while the Asia-Pacific region attracted only 3 percent. A quarter of a century later, in 2023, the Asia-Pacific region share had increased by 25 percentage points, while that of the United States and Canada had declined by 35 points. Meanwhile, in Latin America, the share has remained stagnant at 1 percent, whereas Africa's share has grown from zero in 1997 to 0.8 percent in 2023.

Figure 6 Regional distribution of venture capital deal value, 1997 and 2023

Source: WIPO, based on data published by Refinitiv Eikon (private equity screener), accessed March 2024.

International patent filings

In 2023, international patent filings under the WIPO-administered Patent Cooperation Treaty (PCT) fell by almost 2 percent. This marked the first decline since the financial crisis in 2009, which saw a more significant drop of almost 5 percent.⁶ The growth of patent filings has progressively slowed since 2011 (Figure 7).

Despite a minimal reduction in number, China maintained its position as the leading origin of PCT patent filings, in 2023. The United States and Japan followed, even though they experienced a steeper decline of 5.3 percent and 2.9 percent, respectively. In contrast, India and Türkiye showed substantial growth in PCT filings. India's PCT applications surged by an impressive 44.6 percent, while Türkiye also experienced a significant increase of 8.5 percent.

⁶ For assessments of how IP filings fared during this and previous crises see, WIPO, 2010; WIPO, 2023; and Fink et al., 2022.

Technological progress

Indicators capturing technological progress have exhibited mostly positive and sometimes strongly positive performance. The rapid improvement in computing power consistent with Moore’s Law continues to profoundly shape our world. This is complemented by a swift increase in the availability of drugs, indicating significant progress in health and a consistent reduction in genome sequencing costs, which is critical for advancing medical research.

However, indicators relating to progress in green technologies and the environment showed sub-par progress, as compared to average decade-long growth. Specifically, the speed of making progress in making supercomputers more energy-efficient and renewable energy more affordable is falling behind.

Computing power

The GII Global Innovation Tracker employs two metrics to monitor the balance between technological progress and sustainability: namely, Moore’s Law (a reliable indicator for tracking advancements in computing power) and supercomputer efficiency, which provides a pathway for tracing progress in computing sustainability. Together, these two metrics offer a comprehensive perspective on ongoing efforts at integrating computational advancement with environmental sustainability.

Moore’s Law

Moore’s Law, the empirical observation that the number of transistors on an integrated circuit doubles approximately every two years, continues to hold true. Between 2021 and 2023, the transistor count increased by more than 150 percent, implying a compound annual growth rate of 60 percent. This rate surpasses the long-run rate of around 40 percent annual growth observed over the past decade.

Still, the miniaturization of transistors is becoming increasingly complex, pushing the boundaries of science and technology. As of now, we have achieved 8-nanometer transistors. The anticipated end of Moore’s Law is around 1.5nm to 1nm, at which point the fundamental laws of physics begin to constrict transistor packing.

Green supercomputing

Supercomputers, once confined to scientific research in fields such as climate prediction, genomics and drug discovery, are rapidly permeating the world of business, particularly with respect to the training of AI neural networks. The fastest supercomputers can execute more

than 1 quintillion operations per second, also referred to as an exaflop, a computational capacity equivalent to that of 100,000 laptops.

Despite undergoing an exponential increase in speed over time, these computing systems are notoriously greedy consumers of energy (Figure 8). Efficiency, rather than simply operations per second, is becoming a critical metric for these machines.

The GII Tracker assesses performance based on how many Gigaflops are achieved per Watt of energy consumed. Between 2022 and 2023, the average efficiency of the top 50 “greenest” supercomputers increased by around 14 percent, well below the decade’s compound annual growth rate of 30 percent.

Figure 8 Average speed, power and efficiency of top 50 green supercomputers, 2013–2023

Notes: Average efficiency is calculated as the ratio of average speed to average power for the top 50 green supercomputers. An increase in efficiency can occur even when both speed and power are decreasing. 2013 is the base year and set to 100.

Source: WIPO based on data published by TOP500.

Costs of renewable energy

Between 2021 and 2022, the global weighted-average levelized cost of electricity (LCOE) from newly commissioned solar photovoltaic (PV) and wind power witnessed a reduction of 3.9 percent and 3.5 percent, respectively. Yet, this rate of reduction is substantially lower than the past decade’s compound annual rate of 15 percent for solar and 9 percent for wind.

In 2010, the global weighted-average cost of onshore wind was 95 percent higher than the lowest cost of fossil fuel-fired power. However, by 2022, it was 52 percent lower than the cheapest fossil fuel-fired solutions. Similarly, solar PV, which was 710 percent more expensive than the cheapest fossil fuel-fired solution in 2010, became 29 percent less expensive by 2022, marking a remarkable reduction in cost (IRENA, 2023).

Despite these positive trends, the renewable energy sector faces emerging challenges. The escalating demand for natural resources and manufactured materials, coupled with a reduction in fossil fuel prices from their 2022 peak, could potentially make renewable energy sources less competitive relative to fossil fuels.

Electric battery price

Technological progress has persistently driven down the cost of lithium-ion batteries for over a decade, making electric vehicles (EVs) increasingly affordable. However, 2022 marked a key turnaround, with a first-ever increase in the price of electric batteries following upon an increase in production costs.

This price reversal ended again in 2023, with lithium-ion battery prices hitting an unprecedented low of USD 139 per kWh, marking a substantial 13.7 percent reduction from the 7 percent

increase seen in 2022 (Figure 9). However, the 2023 price reduction is at a lower rate than the long-term price reduction observed over the past decade.

The 2023 price reduction reflects falling raw material and component prices, increased production capacity across the battery value chain and weaker-than-expected demand growth. The industry is also shifting toward new lithium iron phosphate cells, which are significantly cheaper than previous technologies.

Figure 9 Average lithium-ion battery price, 2013–2023

Note: Prices are shown in real 2023 USD.

Source: WIPO, based on data published by BloombergNEF.

Cost of genome sequencing

DNA sequencing plays a crucial role in the understanding of the human genome, and has numerous potential applications in health care, including the rapid diagnosis of complex diseases.

The cost of sequencing an entire genome has fallen dramatically over time. Based on estimates valid for the United States, it has fallen from approximately USD 100 million in 2001 to just over USD 500 in 2023. This rapid reduction in cost, driven by advancements in next-generation DNA sequencing methods, has far outpaced the expected rate of progress predicated on Moore's Law.

Between 2021 and 2023, there was an annualized reduction of 8 percent in the cost of genome sequencing, falling below the long-term trend of a –20 percent CAGR.⁷

Looking ahead, new metrics will be required in order to assess the cost of more advanced DNA sequencing techniques. Emerging long-read DNA sequencing technologies allow for the more accurate identification of complex structural variations. But they are more costly and necessitate different metrics in order to track progress.⁸

⁷ This slowdown can be partially attributed to the cessation of funding for the large-scale sequencing program funded by the National Human Genome Research Institute (NHGRI) and a new cost estimation method, which incorporates additional analysis costs and averages costs across a smaller number of research centers. The earlier cost estimation method represented genome sequencing done by the research center for their own research projects. The newer methods represent costs from those centers but made available to external customers.

⁸ Short-read technologies can assess differences in a person's genome that possibly affect risk of disease. In contrast, long-read DNA sequencing produces data that can inform more accurately how the overall structure of the genome affects biology. Currently, long-read sequencing, costing around USD 3,000, mainly benefits research, but it may eventually be used in health care.

Drug approvals

In this edition of the Tracker, we assess the state of innovation in pharmaceuticals by examining the number of novel active substances (NASs) launched globally. A NAS is defined as a new molecular or biologic entity or combination where at least one element is new (IQVIA, 2024).

In 2023, a total of 69 NASs were introduced globally, marking a significant 9.5 percent increase on the 63 launched in 2022. This figure surpasses the average annual growth rate of 3.7 percent observed over the decade. Still, this is lower than during 2020 and 2021, when the number of drugs introduced surged due to the COVID-19 pandemic before returning to the pre-pandemic trend. In contrast to this year's use of IQVIA data, last year's Global Innovation Tracker relied on Food and Drug Administration (FDA) data for the monitoring of drug approvals. FDA data confirms the positive trend in 2023, with a notable rise of 49 percent in drug approvals after a steep decline in 2022.

Figure 10 shows annual NAS launches between 2013 and 2023 disaggregated by therapeutic area. Around 30 percent of the drugs introduced relate to oncology, 11 percent to neurology and around 10 percent to infectious diseases, together accounting for half of total launches during the period.

Figure 10 Number of yearly drug launches, by therapeutic area, 2013–2023

Source: WIPO, based on data published by IQVIA Institute for Human Data Science.

Technology adoption

In 2023, technology adoption was positive across all the indicators considered. Growth was evident in areas such as robotics and EVs. Connectivity is also expanding rapidly with the rise of 5G networks, promising faster data transmission speeds and a more reliable service. However, despite long-term growth in safe sanitation, the pace of expansion is currently insufficient to meet the United Nations Sustainable Development Goal of universal coverage by 2030. There has been a decline of countries meeting the minimum cancer equipment needs too. The growth rate for the adoption of safe sanitation has also significantly slowed.

Safe sanitation

Safe sanitation, that is, the use of improved sanitation facilities, increased by 1.4 percent between 2021 and 2022, representing 57 per 100 inhabitants. This rate of growth is below the decade's average annual increase of 2.4 percent from 2012 to 2022. A decade ago, under

half of the world's population (45 percent) had access to safe sanitation. This implies that approximately 1.3 billion people have gained access to safe sanitation since 2012.

The most significant progress in safe sanitation access since 2012 has been observed in Central and Southern Asia (+6.6 percent), particularly in India, and East and South East Asia (+4.6 percent), with China leading the way.

However, current rates of international adoption indicate that only 65 percent of the world's population will have access to safe sanitation by 2030. This falls short by 35 points of the Sustainable Development Goal of universal coverage (UNICEF and WHO, 2023).

Connectivity

This year the Global Innovation Tracker includes for the first time data on the proportion of the world's population covered by 5G networks. This is part of the GII's effort to monitor the spread of cutting-edge communication technologies. In 2023, 5G coverage extended to approximately 38 percent of the global population; a notable achievement considering commercial deployment only began in 2019. This represents a close to 25 percent increase on the coverage in 2022 and an annual compound growth rate of 45 percent since 2021. Furthermore, today, 95 percent of the world's population is covered by at least a 3G network (Figure 11),⁹

Coverage varies according to region. Europe leads in 5G deployment, with 68 percent of the population covered, followed by the Americas at 59 percent and the Asia-Pacific region at 42 percent. The Arab States have 12 percent coverage, while the Commonwealth of Independent States (CIS) region and Africa have 8 percent and 6 percent coverage, respectively (ITU, 2023).

The fixed broadband subscription rate rose to around 19 per 100 inhabitants, in 2023, a 4 percent increase on the previous year. This is, however, below the compound annual growth rate of 7 percent over the past decade. Europe leads with 36 per 100 inhabitants, followed by the Americas at 26, the CIS region at 23, Asia-Pacific at 19, the Arab States at 11. Africa has the lowest coverage of all at just 0.8 per 100 inhabitants.

Figure 11 Population coverage by type of mobile network, 2015–2023

Notes: The values for 2G, 3G and 4G represents that proportion of the population that has access to each respective network or a superior one. Data pertaining to 5G coverage is unavailable for years prior to 2021.

Source: WIPO, based on data published by the International Telecommunication Union.

9 Since 2G does not support internet access, we consider 3G coverage.

Robots and automatization

In 2022, the operational stock of robots increased significantly by 12 percent, mirroring the compound growth rate over the past decade. Growth occurred despite supply chain disruptions, with robot adoption reaching new heights. Over 550,000 new installations were recorded, marking a 5 percent increase on the previous record set in 2021. The electronics industry emerged as the leading consumer of robots in 2022, accounting for 28 percent of all new installations. The automotive industry closely followed, with a 25 percent share of new installations (Müller, 2023).

Geographically, the industrial robot market was dominated by five countries: China, Japan, the United States, the Republic of Korea and Germany. Together, these five countries accounted for 74 percent of the operational stock of robots in 2022.

Over time, there has been a noticeable shift in robot adoption. Japan, the United States and Germany have seen a decrease in their share, whereas China's share has increased significantly.

Electric vehicles

The global EV market experienced substantial growth in 2022. The stock of EVs increased by 54 percent that year, slightly below the 10-year average growth rate of 59 percent. The share of EVs rose to 3 percent, in 2022, up from 2 percent in 2021 and a mere 0.07 percent a decade ago (IEA, 2024).

Electric vehicles accounted for 18 percent of global car sales in 2022. The market was dominated by China, Europe and the United States, which together constituted around 95 percent of total EV sales.

Emerging markets and developing economies outside China constituted only a small proportion of the global market. Affordability remains a significant barrier, particularly in low- and lower middle-income economies. Challenges such as limited access to charging infrastructure and EV servicing further impede adoption not only in these economies but also in high-income regions, too.

Nonetheless, 2022 saw a significant surge in electromobility within India, Thailand and Indonesia. Electric car sales in these countries tripled compared to 2021, largely driven by Tata's dominance within the Indian market and government incentives aimed at bolstering EV manufacturing.

Cancer radiotherapy

To better capture the adoption of health-related innovations, the Global Innovation Tracker provides information on the availability of cancer therapy equipment, specifically the number of linear accelerators (LINACs) – devices for delivering high-energy x-rays or electrons to cancers for therapeutic or palliative purposes – per inhabitant.

Data for 2023 shows an around 3 percent rise in the availability of LINACs per capita compared to the previous year, exceeding the average annual global increase in LINAC availability of 1.6 percent over the past decade.

In 2023, 21 out of 100 countries met the minimum radiotherapy requirements set out by the International Atomic Energy Agency (IAEA) Directory of Radiotherapy Centres (DIRAC) (see Data note). Among upper middle-income economies, there has been a notable increase in the percentage of countries meeting radiotherapy requirements. However, the number of lower middle- and low-income economies meeting radiotherapy technology minimum requirements remains low, indicating a persistent divide in access to adequate radiotherapy services.

Socioeconomic impact

In terms of the socioeconomic impact of innovation, many indicators have returned to some growth relative to the results of last year's 2023 edition of the GII. Labor productivity has seen an increase, albeit at a rate below the average for the past decade, with levels slightly above those of 2021. Significant long-term progress has been made in reducing poverty, with the number of people in extreme poverty in 2022 being half of what it was in 2005. However, levels remain above those recorded in 2018, and thus pre-pandemic levels, indicating that more effort is needed if progress is to be sustained or even accelerated.

Life expectancy saw a rapid rise in 2022, but remains at levels last seen in 2015. Also, the disparity between healthy life expectancy and total life expectancy is still to be addressed. On environmental issues, the world is falling further behind. After a temporary reduction in 2020, carbon emissions are growing once. The year 2023 was the hottest on record, highlighting an urgent need for effective climate action.

Labor productivity

Labor productivity showed an increase of around 1 percent between 2022 and 2023, an improvement from the sluggish growth of around 0.2 percent observed between 2021 and 2022. In terms of output per worker, there has been a notable increase, from around USD 43,000 in 2012 to USD 51,000 in 2023.

Despite this positive trend, the current growth rate still lags behind the decade average of 2.2 percent productivity growth; a trend further discussed in the context of two possibly new Digital Age and deep Science Innovation waves in the GII 2022 special theme [What is the future of innovation-driven growth?](#)

Poverty

This year, the Global Innovation Tracker incorporates data on poverty. In 2022, approximately 712 million people were living in extreme poverty, defined as subsisting on less than USD 2.15 a day (2017 PPP) – a 5 percent decrease on the previous year. Comparatively, in 2012, the number of people living in poverty was 936 million, representing a reduction of over 200 million individuals over the decade (Figure 12).

Since the 2000s, the share of the global population living below the lower middle-income (USD 3.65) and the upper middle-income (USD 6.85) poverty line also shrank. Currently, nearly 2 billion people live on under USD 3.65 a day, and more than 3.5 billion people (around half of the world's population) live below the USD 6.85 threshold. Despite the 2022 improvement, poverty is still greater today than it was before the pandemic struck.

Figure 12 Population living in poverty, by income threshold, 1981–2022, USD PPP 2017

Source: WIPO, based on data published by World Bank, Poverty and Inequality Platform.

Life expectancy

Globally, average life expectancy at birth is now around 20 years longer than it was back in 1960, when it stood at 51 years. However, COVID-19 caused a marked decline in life expectancy, and recovery has been gradual.

Following two consecutive periods of unprecedented decline – a 1 percent decrease between 2019 and 2020, and a further 1.3 percent decrease between 2020 and 2021 – life expectancy rose by around 1 percent in 2022. As of 2022, the life expectancy of a representative individual is 72 years, the same as in 2015. A decade earlier, in 2012, life expectancy was slightly lower, at 71 years (Figure 13).

Despite improvements, significant disparities in life expectancy persist. There remains a striking gap of approximately 30 years between the highest and lowest life expectancies. For instance, in Japan, life expectancy is slightly below 84 years, whereas in some other countries it is around 55 years. This gap has narrowed over time since 1960, when it was 45 years. Additionally, a notable disparity exists between life expectancy at birth and healthy life expectancy at birth (HALE). This gap has remained fairly constant since the start of the millennium, at around 9.5 years.

Figure 13 Life expectancy and healthy life expectancy at birth (years), 2000–2022

Source: WIPO, based on data published by World Bank (LE) and World Health Organization (HALE).

Global warming

In an effort to understand both the impact of economic activity on the climate and the potential mitigation strategies through innovation, this year's Global Innovation Tracker includes data on global warming. This approach aligns with the global commitment made in 2015 under the Paris Agreement, when countries worldwide agreed to a long-term goal of limiting the rise in global surface temperature to no more than 2°C above pre-industrial levels, with a preferred limit of 1.5°C.¹⁰

Notably, 2023 marked a significant milestone in being the hottest year on record, with the global temperature 1.17°C above the baseline period (1951–1980).¹¹ Problematically, the average temperature in 2023 was only 0.13°C below the preferred 1.5°C target and 0.63°C below the maximum 2°C target, thresholds that are quite likely to be surpassed in the coming decades (Figure 14).

¹⁰ See <https://unfccc.int/documents/184656>

¹¹ Temperature variations occur within the context of an overall upward trend driven by human activity, with fluctuations due to natural phenomena such as El Niño and La Niña events or volcanic eruptions.

Furthermore, carbon dioxide (CO₂) emissions are on the rise. In 2022, CO₂ emissions returned to pre-COVID-19 pandemic levels, increasing by 0.9 percent compared to 2021. Fossil CO₂ emissions are expected to have risen further in 2023, to 1.4 percent above 2019 levels (Figure 15).

Figure 14 Global temperature anomaly, 1951–2023 land–ocean global mean temperature

Notes: COP 15 (lower threshold) indicates the lower limit of 1.5°C global warming relative to the pre-industrial temperature. This corresponds to a temperature increase of 1.3°C with respect to the average temperature from 1951 to 1980. Lowess smoothing denotes Locally Weighted Scatterplot Smoothing with a fifth-degree polynomial.

Conclusion

The Global Innovation Tracker 2024 provides a comprehensive analysis of the current state of global innovation, revealing a complex landscape subject to economic, geopolitical and technological factors. Findings serve to highlight progress, as well as challenges across four key stages of the innovation cycle: science and innovation investment, technological progress, technology adoption, and the socioeconomic impact of innovation.

In conclusion, while global innovation has remained resilient over the past few years, it faces significant economic and geopolitical headwinds. Despite continued technological progress and growing technology adoption, achieving socioeconomic progress remains a challenge. The path forward requires sustained investment, the enhanced adoption of breakthrough technologies, and comprehensive strategies to harness innovation for socioeconomic and environmental benefit. The outlook for 2024 and 2025 remains uncertain, necessitating vigilant monitoring and adaptive strategies to navigate the evolving global landscape.

At this point, an important reminder is in order: the GII Global Innovation Tracker makes a significant effort to capture innovation investment and technological progress, adoption and impact through a limited set of indicators and to provide high-level trends via the Dashboard. While the indicators for investment impact are quite standard and comprehensive, the other indicators on technological progress, adoption and impact are more selective and experimental, and might not exhaustively capture today's broad range of innovative activity. Nonetheless, we hope this evolving tool will trigger a sound debate on better innovation measurement and policy, which will in turn improve both the innovation metrics and the Tracker itself, as a consequence.

Data notes

Scientific publications captures the number of peer-reviewed articles published in the Social Sciences Citation Index (SSCI) and Science Citation Index Expanded (SCIE). Source: Web of Science (Clarivate), <https://apps.webofknowledge.com>.

R&D investments captures R&D expenditures worldwide in PPP-adjusted constant 2015 prices. The 2022 values were calculated using available real data of gross expenditure on R&D (GERD) and business enterprise expenditure on R&D (BERD) at the country level from the UNESCO Institute for Statistics (UIS) online database; the OECD's Main Science and Technology Indicators (MSTI) database (March 2024 update); Eurostat and the Ibero-American and Inter-American Network of Science and Technology Indicators (RICYT). For those countries for which data were unavailable for 2022, the 2022 data were estimated using the last observation carried forward (LOCF) method for R&D intensities (R&D expenditures as a percentage of GDP) and applied to GDP PPP for the same year. R&D expenditures for 2023 were estimated for all countries, using the latest available R&D intensity and estimations of GDP growth at constant prices from the International Monetary Fund, World Economic Outlook Database, April 2024.

Top corporate R&D spenders' data is sourced from the European Commission's 2023 EU Industrial R&D Investment Scoreboard and further analyzed using WIPO calculations and the Bureau van Dijk (BvD) Orbis database, with all figures reported in current US dollars. The choice of the US dollar as the currency was arbitrary; however, its recent appreciation affects the valuation of R&D spending in foreign currencies, potentially skewing the perceived trends in R&D expenditure across different regions. To address these fluctuations and provide a more balanced view, the approach considers the contribution of each country to global R&D, weighting it according to their share of total R&D expenditure. The PPP-adjusted constant 2015-dollar measure is utilized to calculate each country's share in a given year. The R&D figures are then aggregated using a weighted average method, where these proportional shares serve as weights to compute the annual growth rates. This method helps mitigate the impact of currency valuation changes, offering a clearer picture of actual spending trends in R&D across various regions.

Venture capital (VC) deals refers to the absolute number of VC deals received by companies located within a region. VC value refers to the total amount of current US dollars invested – via venture capital – into companies located within a region. Source: Refinitiv Eikon data on private equity and venture capital, www.refinitiv.com/en/products/eikon-trading-software/private-equity-data.

International patent filings refers to the total number of patent applications filed through the WIPO-administered Patent Cooperation Treaty. Source: WIPO IP Statistics Data Center, www.wipo.int/ipstats. See also WIPO (2024).

Microchip transistor count (Moore's Law) refers to the number of transistors to be found on the most advanced, commercially available microchips in a given year. Source: Karl Rupp, <https://github.com/karlrupp/microprocessor-trend-data>.

Green supercomputers average efficiency of top 50 systems on the Green500 list. The Green500 ranks the most energy-efficient computer systems, by measuring computational capacity per unit of energy consumed (Gflops/Watts). Source: TOP500 (November 2023), www.top500.org/lists/green500.

Cost of renewable energy captures the global weighted average levelized cost of electricity (LCOE) generation of solar photovoltaics and onshore and offshore wind. 5G coverage refers to the percentage of the population covered by 5G mobile network technology. Source: International Telecommunication Union (ITU), www.itu.int/en/ITU-D/Statistics/Pages/facts.

Robots is a measure of the number of robots currently deployed in industrial automation applications (also known as the operational stock of industrial robots). The stock is calculated assuming an average service life of 12 years with immediate withdrawal from service at the end of the period. Source: International Federation of Robotics (IFR), https://ifr.org/img/worldrobotics/Executive_Summary_WR_Industrial_Robots_2023.pdf.

Electric vehicle (EV) stock is the number of passenger cars worldwide that are battery electric vehicles (BEVs) or plug-in hybrid electric vehicles (PHEVs). EV share is the percentage of the total passenger car stock that is electric. Source: International Energy Agency, *Global EV Outlook 2024*. <https://www.iea.org/data-and-statistics/data-tools/global-ev-data-explorer>.

Cancer radiotherapy refers to the total number of linear accelerators per inhabitant. Linear accelerators (LINACs) are devices for delivering high-energy x-rays or electrons to cancers for a therapeutic purpose. A higher ratio indicates a better-equipped health care system. Penetration rate refers to the number of countries that meet minimal radiotherapy resource requirements worldwide, based on a rough assumption that one in every two cancer cases requires radiotherapy and that one machine is needed for every 500 patients requiring radiotherapy. Source: Special tabulations by International Atomic Energy Agency (IAEA) Directory of Radiotherapy Centres (DIRAC) for the GII based on IAEA DIRAC (<https://dirac.iaea.org>) and IARC GLOBOCAN (<https://gco.iarc.fr>) databases.

Labor productivity (rates) refers to the world total of output per hour worked; (levels) refers to the world total of output per employee. Both indicators were estimated by The Conference Board. Source: The Conference Board Total Economy Database™, May 2024, <https://conference-board.org/data/economydatabase>.

Poverty refers to that part of the population living below the poverty line of USD 2.15 a day (2017 PPP). Source: World Bank Poverty and Inequality Platform, <https://pip.worldbank.org>.

Life expectancy refers to the number of years a newborn infant could be expected to live, if patterns of mortality prevailing at the time of birth were to stay the same throughout its life. Source: World Development Indicators, <https://databank.worldbank.org/source/world-development-indicators>.

Air temperature refers to the global mean estimate temperature anomaly with respect to the base period 1951–1980 based on land and ocean data. Source: NASA GISS, <https://data.giss.nasa.gov/gistemp>.

GII 2024 results

The GII unveils the world's innovation leaders, gauging the innovation performance of 133 economies.

This section presents the highlights of the Global Innovation Index 2024 (GII), including a discussion on the top ranked economies by income group and world region, as well as identifying those economies that are overperforming on innovation relative to their level of development.

The GII 2024 rankings are mainly derived from 2022 and 2023 data points (about 80 percent of all data). Appendix I provides details on how to interpret the results, cautioning against simple year-on-year comparison of the GII rankings.

Innovation leaders in 2024

Asian middle-income economies China, India, Indonesia and Türkiye surge ahead. Thailand and Viet Nam move closer to the top 40. Morocco joins the group of middle-income economies within the GII top 70 that have climbed fastest in the GII ranking since 2013.

Switzerland ranks 1st in the GII for the 14th consecutive year (Figure 16). It is still the global leader in innovation outputs, ranking 1st in both Knowledge and technology outputs and Creative outputs. It also ranks in the top 5 of all the other GII pillars, with the exception of Infrastructure (7th). Sweden and the United States (US) maintain their respective 2nd and 3rd positions for the second consecutive year. Sweden leads in Infrastructure (1st), Business sophistication (1st), Knowledge and technology outputs (2nd) and Human capital and research (3rd). It holds top positions for its Researchers (1st), Intellectual property (IP) payments and receipts (both 1st), its Knowledge-intensive employment (3rd), its Global brand value (3rd) and its Low-carbon energy use (4th). The United States scores best in the world in nine of the 78 GII 2024 innovation indicators – behind Singapore. It ranks 1st in the world in indicators that include the quality of its universities, the impact of its scientific publications (H-index), software spending and IP receipts (Box 1).

Singapore (4th) moves further into the top 5 and is the economy with the greatest number of GII indicators ranking 1st in the world for the first time (with 14 out of 78 indicators – Box 1), overtaking the United States. However, even if Singapore moves closer to the top 3, breaking into that group remains challenging. The top 3 economies share the characteristics of both excelling across all GII pillars and successfully balancing their innovation inputs and outputs (Table 4). Even though Singapore has already surpassed Switzerland, Sweden and the United States in terms of innovation inputs, the gaps between Singapore and the top 3 still remain large in innovation outputs, and especially in Creative outputs.

The Republic of Korea moves up to 6th position and ranks in the top 3 worldwide in key indicators including Researchers (2nd), R&D expenditures (2nd), R&D performed by business (1st) and Production and export complexity (3rd).

Box 1 GII innovation indicators – 2024 trailblazers

Singapore takes the lead in 2024 in terms of the number of GII innovation indicators in which it ranks top globally, ranking 1st in the world in 14 out of 78 indicators and overtaking the United States. It leads in Regulatory quality, Policy stability for doing business, ICT access, Logistics performance, Venture capital received, Venture capital investors, High-tech manufacturing and GitHub commits.

The United States follows Singapore globally, ranking 1st worldwide in nine indicators (four less than in 2023), including holding the top spot in Global corporate R&D investors, Unicorn valuation and Intangible asset intensity. China follows in 3rd place, leading in eight innovation indicators (two more than in 2023), including Utility models, Trademarks and Industrial designs. Switzerland comes next, in 4th place, attaining the top ranking in University–industry R&D collaboration, Intellectual property payments and receipts and PCT patents. Japan, Israel, Hong Kong, China and Luxembourg, tie in 5th place, ranking 1st in six indicators, including Public research–industry co-publications, GERD performed by business, High-tech imports and Knowledge-intensive employment, respectively. They are followed by Sweden, the Republic of Korea and Iceland, tying in 9th place, leading in Researchers, Researchers working in the private

sector (Research talent) and Low-carbon energy use, respectively.

In addition, certain middle- and low-income economies are excelling in various domains. Relative to other countries and to their own GDP or population, the Plurinational State of Bolivia, Cambodia and Nepal rank 1st in Loans from microfinance institutions, Malaysia in Graduates in science and engineering and Mexico in Creative goods exports. Correspondingly, Morocco leads in Industrial designs, the Islamic Republic of Iran in Trademarks and Namibia in Expenditure on education.

Box Table 1 Economies with the most GII indicators ranked top, 2024

Economy	Inputs	Outputs	Total
Singapore	9	5	14
United States	3	6	9
China	3	5	8
Switzerland	3	4	7
Japan	3	3	6
Israel	4	2	6
Hong Kong, China	4	2	6
Luxembourg	5	1	6
Sweden	2	3	5
Republic of Korea	2	3	5
Iceland	3	2	5

Note: The GII methodology allows multiple economies to rank 1st on any one indicator; see Economy profiles and Appendix I.

Source: Global Innovation Index Database, WIPO, 2024.

China moves up the ranking to 11th position, edging closer to the top 10 again. It maintains its 1st position among the upper middle-income group and 3rd position among economies in South East Asia, East Asia and Oceania, behind Singapore and the Republic of Korea. China is also the third economy with the greatest number of indicators ranked 1st, two more than in 2023, behind Singapore and the United States (Box 1). It ranks in the top 3 globally in indicators such as High-tech exports (1st), Global corporate R&D investors (2nd), Labor productivity growth (2nd) and GERD financed by business (3rd).

Japan remains firmly at the 13th rank – a position it has held since 2021. Canada makes a comeback, rising to 14th position, its best rank since 2014. It holds the highest rank globally in Venture capital (VC) recipients (1st), and Joint venture/strategic alliance deals (1st). It also holds tops ranks for the quality of its universities (4th) and the impact of its scientific publications (H-index – 4th).

Ireland (19th) and Luxembourg (20th) enter the top 20, climbing three ranks and one rank, respectively (Figure 17). In part influenced by the strong presence of foreign multinationals in the field of ICT, Ireland ranks top globally in ICT services exports (1st) and Intellectual property payments (1st) and ranks in the top 3 for its Intangible asset intensity (2nd).

Australia (23rd) and New Zealand (25th) also continue to move upward within the top 25. Australia excels in the quality of its universities (3rd), the impact of its scientific publications (6th) and its Knowledge-intensive employment (9th). New Zealand enters the top 25 with high rankings in Regulatory environment (5th), Firms offering formal training (5th) and Domestic credit to private sector (9th).

Figure 16 The GII dynamo: The top 15 innovators, 2020–2024

Note: Year-on-year comparisons of GII rankings need to take into account changes to the GII model that have occurred over time, as well as data availability.

Source: Global Innovation Index Database, WIPO, 2024.

European Union (EU) economies Cyprus (27th), Spain (28th) and the Czech Republic (30th) move up within the top 30, while Poland (40th) makes it into the top 40 (Figure 17). Beyond the EU, European economies Serbia (52nd) and Montenegro (65th) continue to improve their ranking, with Montenegro entering the top 70.

Apart from China, there are only four other middle-income economies among the top 40 economies this year: namely, Malaysia (33th), Türkiye (37th), Bulgaria (38th) and India (39th). However, Thailand (41st) and Viet Nam (44th) move ahead, consolidating their positions in the top 45 and moving towards the top 40. With its best rank since 2009, Thailand is sustaining its long-term progression. Türkiye is also moving ahead, claiming 3rd position among the upper middle-income economies and overtaking Bulgaria. All these middle-income economies, with the exception of Bulgaria, moved up in the rankings this year.

The United Arab Emirates remains in 32nd place. Saudi Arabia (47th) and Qatar (49th) continue to climb upward into the top 50 and are the only two economies in the Middle East region to move up the ranking this year (Figure 17). Taking a broader view, among the Middle East economies,

only the United Arab Emirates (32nd), the Islamic Republic of Iran (64th) and Oman (74th) have improved their position since 2013.

Georgia (57th) and Armenia (63rd) make important improvements, entering the top 60 and top 70, respectively. However, the position of both economies in the ranking has fluctuated over the years.

Northern African economies Morocco (66th) and Algeria (115th) experience notable improvements in their innovation ranking. Together with China, India, Indonesia (54th), the Islamic Republic of Iran (64th), the Philippines (53rd), Türkiye and Viet Nam, Morocco joins the group of middle-income economies within the GII top 70 that have made the biggest advances in the GII ranking since 2013 (Figure 17). Algeria ranks in the top 10 in Expenditure on education (10th), and in the top 20 globally for its Graduates in science and engineering (20th). It also made important progress in IP-related indicators including Patents (65th, up by 15 with its number of resident patent applications almost doubling in 2022), Trademarks (87th) and Industrial designs (46th).

Egypt holds the 86th position, with Cairo also entering the GII top 100 science and technology clusters ranking for the first time in 2024 (see Cluster ranking).

Brazil (50th) remains in the top 50 in 2024, keeping its leading position in Latin America and the Caribbean, ahead of Chile (51st) and Mexico (56th), both of which also move up the ranking. Moreover, Colombia (61st), Costa Rica (70th) and Paraguay (93rd) make the greatest headway in the region, with Costa Rica entering the top 70. Caribbean economy Barbados enters the GII in 2024 at the 77th position, after taking active steps to improve its innovation indicators (see Box 2).

The Philippines (53rd) and Indonesia (54th) continue to improve their GII ranking, with both entering the top 55. The Philippines claims 3rd position in the lower middle-income group. Indonesia enters the top 60 and is the economy in South East Asia, East Asia and Oceania that makes the greatest advancement in ranks in 2024. It makes notable improvements in Policy stability for doing business (13th) and key IP indicators, such as Industrial designs (64th), Trademarks (72nd) and PCT patents (82nd), even if these are still at moderate levels.

Ukraine (60th) drops by five positions and is now 4th among the lower middle-income group (Table 2). Its position is mostly affected by falls in indicators related to its Institutions (107th) and its Human capital and research (54th), including Tertiary enrolment (44th), School life expectancy (76th), Government effectiveness (99th) and Rule of law (115th). Foreign direct investment (FDI) inflows (88th) also dropped considerably.

In the last five years, Indonesia, Mauritius (55th), Saudi Arabia, Qatar, Brazil and Pakistan (91st) made the greatest advances in the GII, in order of their rank progression (Figure 17). Saudi Arabia performs relatively better in innovation inputs (36th) and excels in Market capitalization (1st), State of cluster development (2nd) and Global corporate R&D investors (16th). In contrast, Pakistan performs relatively well in innovation outputs, excelling in Mobile app creation (14th), ICT services exports (22nd) and Software spending (24th).

In Central and Southern Asia, Kazakhstan (78th) enters the top 80 (Figure 17). Kazakhstan performs better in innovation inputs (72nd), excelling in Government's online service (8th), Utility models (10th), E-participation (15th) and Entrepreneurship policies and culture (25th). Uzbekistan (83rd) remains in the top 85 and is the 10th ranking economy among the lower middle-income group (Table 2) – a significant improvement since 2013, when it held the 133rd spot. Sri Lanka (89th) consolidates its place in the top 90, while Kyrgyzstan (99th) takes a big stride into the top 100. Taking a longer term view, all economies in the region have made sustained progress in their rankings over the past decade. Uzbekistan, the Islamic Republic of Iran, Pakistan and India have made the largest advancements, in that order.

Eight out of the 27 economies from Sub-Saharan Africa (SSA) covered this year improve their ranking. Mauritius (55th) moves forward into the top 55, Cabo Verde (90th) consolidates its place in the top 90 while Senegal (92nd) moves closer to it. Kenya (96th) makes the largest improvement in the region, advancing four ranks into the top 100. Kenya improves notably in innovation outputs (87th, up by four positions), and in particular in Knowledge and technology outputs. Its most notable improvements are in the IP-related indicators Utility models (15th), Patents by

origin (49th) and PCT patents (69th), all of which go up by around 20 ranks. It also makes notable improvements in ICT services exports (17th).

Beyond the top 100, Tajikistan (107th), Algeria (115th) and Burundi (127th) have progressed the most in the rankings. Bangladesh (106th) and Madagascar (110th), despite setbacks in 2024, have demonstrated GII rank improvements over the long run.

Burundi is the only low-income economy that moved up the ranking this year, while Uganda's ranking remains unchanged, in 121st position globally and 4th among its income group (Table 2).

Figure 17a Breaking barriers: Economies soaring to new heights in innovation, 2024

Note: Year-on-year comparisons of GII rankings must take into account changes to the GII model that have occurred over time, as well as data availability.

Figure 17b Economies climbing the ladder

Top climbers since 2013

Top climbers since 2019

China (11th), Türkiye (37th), India (39th), Viet Nam (44th), the Philippines (53rd), Indonesia (54th), the Islamic Republic of Iran (64th) and Morocco (66th) are the group of middle-income economies within the GII top 70 which have climbed fastest in the ranking since 2013.

Standout economies' 5-year innovation surge, 2019–2024

In the last five years, Indonesia (54th), Mauritius (55th), Saudi Arabia (47th), Qatar (49th), Brazil (50th) and Pakistan (91st) ascended the most (in order of their rank progression).

Box 2 outlines important “dos and don’ts” to bear in mind when using the GII to improve an economy’s innovation performance.

Box 2 How to best use the Global Innovation Index and what not to do

For many years, governments around the world have successfully used the GII to improve their economies’ innovation performance and shape evidence-based innovation policies. A survey carried out by WIPO in 2024 showed that 77 percent of WIPO member states were using the GII to improve innovation ecosystems and metrics (up by roughly 20 percent in comparison to 2022, with 91 out of 118 responding member states using the GII), as well as it being a benchmark for national innovation policies or economic strategies across all world regions.

One major benefit of the GII is that it puts evidence and metrics at the core of conceiving, deploying and evaluating innovation policies. A first step brings together statisticians, innovation actors and policymakers to develop a clear understanding of a country’s innovation performance. In a second step, the policy discussion turns to leveraging domestic innovation opportunities, while at the same time overcoming country-specific weaknesses. Both steps are an exercise in coordination among different public and private innovation actors, as well as between government entities. In a number of countries, the GII has facilitated such a dialogue between these actors.

Some dos:

- Ensure that innovation is embedded as a key priority in a country’s pathway to national development and progress, possibly formulated within a clear innovation policy.
- Establish a cross-ministerial task force to pursue innovation policy matters through a “whole of government approach,” ideally reporting to the top tier of government (for instance, the prime minister’s office).
- Ensure that any innovation policy task force consults with innovation actors from both the private and public sectors, including startups, research universities and innovation clusters.
- Ensure that any national intellectual property (IP) policy is aligned with or integrated into the innovation law or strategy.
- Ensure that the targets of an innovation policy are clear, quantifiable and can be evaluated.

Some don'ts:

- Avoid nominating a single government entity to oversee the GII data and policy work, such as the intellectual property office or one ministry. This is a team effort involving different government entities, not the responsibility of one body working alone.
- Do not set overly ambitious, and therefore unrealistic, GII ranking targets. GII rankings rarely increase in leaps and bounds from one year to the next, particularly within the top 50.
- Do not expect policy changes to result in immediate improvement in GII indicator performance. There are significant lags between the formulation of innovation policy, its execution and its impact. The latest available innovation data is also rarely current, often lagging by a few years.
- Do not treat the GII as a mathematical exercise – that is, by attempting to collect or focus on specific indicators simply to climb the ranking. A country's GII rank alone is only a partial reflection of a national innovation ecosystem and related progress. Moreover, the GII framework changes regularly. Note also that the year-on-year changes within the GII are influenced by relative performance in relation to other countries, together with other methodological considerations (see Appendix I). Setting objectives over a period of years (for example, three to five years) and then reviewing combined progress over several years is a more appropriate way of using the GII.

With these caveats in mind, the GII has become a catalyst for the national collection of innovation indicators. As detailed in Appendix III, the vast majority of GII data is not collected by the World Intellectual Property Organization (WIPO) itself directly from its member states. Instead, WIPO uses data submitted by economies to those organizations that are globally responsible for collection of specific data (for example, the UNESCO Institute for Statistics for data relating to R&D).¹ For all other data sets, the GII team can help countries identify missing and outdated data (marked clearly in the economy profiles and briefs) and advise data collectors on how to remedy the situation. This system has proven remarkably effective in building more global and inclusive innovation and related data sets in WIPO's partner organizations, with better data coverage across all United Nations member states, effectively contributing to a useful public good that facilitates better innovation policymaking.

Finally, a new trend is the interest being expressed by countries in building sub-national innovation indices at the regional or city level that mirror the GII framework or comprise selected GII indicators.² WIPO is supporting this work in two ways: (i) by organizing workshops on the exchange of best practice, and (ii) by providing a background study on sub-national innovation indices. Member states are welcome to participate in these events and efforts, and to provide additional information on their sub-national innovation index plans and needs.

Innovation overperformers

India, the Republic of Moldova and Viet Nam continue to lead as the longest-standing innovation overperformers. Indonesia, Pakistan and Uzbekistan maintain their status as overperformers for a third consecutive year.

In the GII 2024, 19 economies are performing above expectation relative to their level of development – these are the GII innovation overperformers (Figure 18 and Table 3).

India, the Republic of Moldova and Viet Nam continue to be record holders by being innovation overperformers since 2011, for a 14th consecutive year. Viet Nam (44th) scores above its income level in all GII pillars, and even above the upper middle-income group, with the exception of Human capital and research. The Philippines (53rd) and Morocco (66th) keep their innovation

1 The sole exception is the intellectual property data that WIPO collects annually from member states. See <https://www.wipo.int/web/ip-statistics>.

2 The recent WIPO study reviews the applicability of the GII framework to the development of sub-national innovation metrics. It analyses the existing sub-national innovation indices of WIPO member states who are pioneers in this field. It also determines which future innovation metrics are applicable to the measurement of innovation at the sub-national level, particularly those exploiting “big data” and new computational methods. See WIPO (2024a).

overperformer status for a sixth time, and both move up in the rankings this year. Senegal (92nd) retains its overperformer status again this year, after regaining its place in the prestigious list in 2023. In addition, Indonesia (54th), Uzbekistan (83rd) and Pakistan (91st) keep their overperformer status for a third consecutive year.

From a regional perspective, South East Asia, East Asia, and Oceania and Sub-Saharan Africa still have the same number of overperformers, with five each. Central and Southern Asia holds 3rd place, while Europe, Latin America and the Caribbean and Northern Africa and Western Asia tie in 4th place, with two overperforming economies each (Table 3).

Conversely, 41 economies are performing below expectation on innovation, the majority from Latin America and the Caribbean and Sub-Saharan Africa (both with 11 economies each). Among the high-income group, six are economies from Northern Africa and Western Asia: namely, the United Arab Emirates (32nd), Saudi Arabia (47th), Qatar (49th), Kuwait (71st), Bahrain (72nd) and Oman (74th), driven in large part by their natural-resource-driven high GDP per capita – a key factor for this analysis. In the upper middle-income group, three economies which perform below expectation are European economies, notably the Russian Federation (59th), Montenegro (65th) and Belarus (85th). In the lower middle-income group, 10 economies are performing below expectation for their level of development.

Figure 18 Innovation overperformers, relative to their economic development

Table 3 Innovation overperformers in 2024: Income group, region and years as an innovation overperformer.

Economy	Income group	Region	Years as an innovation overperformer (total)
India	Lower middle-income	Central and Southern Asia	2011–2024 (14)
Republic of Moldova	Upper middle-income	Europe	2011–2024 (14)
Viet Nam	Lower middle-income	South East Asia, East Asia, and Oceania	2011–2024 (14)
Mongolia	Lower middle-income	South East Asia, East Asia, and Oceania	2011–2015, 2018–2024 (12)
Rwanda	Low-income	Sub-Saharan Africa	2012, 2014–2024 (12)
Ukraine	Lower middle-income	Europe	2012, 2014–2024 (12)
Thailand	Upper middle-income	South East Asia, East Asia, and Oceania	2011, 2014–2015, 2018–2024 (10)
Jordan	Lower middle-income	Northern Africa and Western Asia	2011–2015, 2022–2024 (8)
Madagascar	Low-income	Sub-Saharan Africa	2016–2018, 2020–2024 (8)
Senegal	Lower middle-income	Sub-Saharan Africa	2012–2015, 2017, 2023–2024 (7)
South Africa	Upper middle-income	Sub-Saharan Africa	2018–2024 (7)
Morocco	Lower middle-income	Northern Africa and Western Asia	2015, 2020–2024 (6)
Philippines	Lower middle-income	South East Asia, East Asia, and Oceania	2019, 2020–2024 (6)
Burundi	Low-income	Sub-Saharan Africa	2017, 2019, 2022–2024 (5)
Brazil	Upper middle-income	Latin America and the Caribbean	2021–2024 (4)
Jamaica	Upper middle-income	Latin America and the Caribbean	2020, 2022–2024 (4)
Indonesia	Upper middle-income	South East Asia, East Asia, and Oceania	2022–2024 (3)
Pakistan	Lower middle-income	Central and Southern Asia	2022–2024 (3)
Uzbekistan	Lower middle-income	Central and Southern Asia	2022–2024 (3)

Note: Income group classification follows the World Bank Income Group Classification (July 2023). Geographical regions correspond to the United Nations publication on standard country or areas codes for statistical use (M49).

Efficiency champions: Converting innovation investment into tangible innovation output

Middle-income economies, such as China and Türkiye, outdo their high-income peers in innovation outputs

Among high-income economies, Switzerland (1st) leads in producing higher levels of outputs compared to Sweden (2nd), the United States (3rd) and Finland (7th), while the United Kingdom (5th) and the Republic of Korea (6th) produce higher levels of outputs than the United States, but with lower input levels (Figure 19).

Among the upper middle-income group economies, China (11th) also shines, producing levels of outputs that are higher than those of high-income economies, such as Singapore (4th), Finland (7th), the Kingdom of the Netherlands (8th), Denmark (10th) and France (12th), but with fewer inputs. Türkiye (37th) does likewise relative to Iceland (22nd) and Australia (23rd); while Bulgaria (38th) also surpasses the level of outputs of New Zealand (25th) with lower input levels.

Among the lower middle-income group economies, the Islamic Republic of Iran (64th), Morocco (66th) and Pakistan (91st) are efficient innovators, while Madagascar (110th) stands out among the low-income group for its innovation efficiency.

However, certain economies, including Australia (23rd), the United Arab Emirates (32nd), Saudi Arabia (47th), Botswana (87th), Cabo Verde (90th) and Rwanda (104th), find it harder to translate inputs into outputs. This year, Serbia (52nd), Montenegro (65th), Peru (75th), Kazakhstan (78th), Azerbaijan (95th) and Kyrgyzstan (99th) have improved their performance in converting inputs into outputs.

Innovation leaders (top 25) demonstrate balanced and strong performance across all seven pillars. Beyond the top 10, which all have balanced ecosystems, this group includes France (12th), Japan (13th), Canada (14th), Estonia (16th), Austria (17th), Norway (21st) and Australia (23rd) (Table 4). Some lower ranked economies excel in specific innovation pillars, such as Botswana and Rwanda in Institutions (36th and 38th, respectively), Kyrgyzstan in Human capital and research (42nd), Albania (84th) in Infrastructure (31st) and the Islamic Republic of Iran and Cambodia in Market sophistication (17th and 39th, respectively). Barbados and Costa Rica rank relatively highly in Business sophistication (49th and 50th, respectively). India and Hungary excel in Knowledge and technology outputs (22nd and 25th, respectively), while Türkiye and Mongolia shine in Creative outputs (16th and 32nd, respectively). These examples showcase the diverse strengths of economies that are vibrant in innovation, which can be nurtured to enhance their overall rankings.

Figure 19 Innovation input to output performance, 2024

Note: Line corresponds to the fitted line between the input score and output score of all economies included in the GII 2024.

Source: Global Innovation Index Database, WIPO, 2024.

Innovation across the world's regions

Central and Southern Asia further narrows the gap with Latin America and the Caribbean, and outpaces it in innovation outputs

For yet another year, there are no changes in the rankings of the world's regions, based on an unweighted average GII score of all economies within a region. Northern America and Europe continue to lead, followed by South East Asia, East Asia, and Oceania (SEAO). Northern Africa and Western Asia follow, while Latin America and the Caribbean, Central and Southern Asia (CSA) and Sub-Saharan Africa follow at a greater distance. However, this year the distance dividing economies in Latin America and the Caribbean and CSA is very small – on average no more than 0.10 GII score points. In fact, on average, economies in CSA have already surpassed Latin American and Caribbean economies in innovation outputs (by an average of 1.3 GII score points) but remain behind in innovation inputs (by an average of 1.5 score points).

Northern America

Largely driven by the United States, Northern America, which comprises the United States and Canada, is still the most innovative world region, maintaining a comfortable performance gap in relation to Europe. The United States holds stable in 3rd position, while Canada moves up to 14th place. Canada performs well in Market sophistication (4th), Business sophistication (13th), Human

capital and research (11th) and Institutions (14th), ranking ahead of the United States in the latter two pillars. It continues to rank in the top 10 for its University–industry R&D collaboration (5th), its Researchers working in the private sector (Research talent, 8th) and its Intellectual property payments (9th).

Europe

Europe still hosts the highest number of innovation leaders among the top 25 – 15 in total, with seven among the top 10. Malta (29th) exits the group of innovation leaders this year. Out of the 39 European economies covered, only nine move up the ranking this year (10 fewer than last year): namely, Austria (17th), Ireland (19th) and Luxembourg (20th) (the latter two both entering the top 20), Spain (28th), the Czech Republic (30th) (entering the top 30), Poland (40th) (entering the top 40), Croatia (43rd), Serbia (52nd), and Montenegro (65th) (reaching the top 70).

Among economies that are improving, Austria excels in Domestic industry diversification (3rd), Production and export complexity (7th), R&D expenditures (8th), which reached 3.2 percent of GDP in 2022, and Public research–industry co-publications (8th). Spain is performing well in Software spending (12th), Industrial designs (13th) and Global corporate R&D investors (15th).

Serbia gets closer to the top 50 with a strong performance in Domestic industry diversification (11th), ICT services exports (12th), Scientific and technical articles (13th) and Cultural and creative services exports (14th).

South East Asia, East Asia, and Oceania

Seven South East Asia, East Asia, and Oceania (SEAO) economies are world innovation leaders – one more than in 2023 – namely, Singapore (4th), the Republic of Korea (6th), China (11th), Japan (13th), Hong Kong, China (18th), Australia (23rd) and New Zealand (25th). New Zealand goes up by two ranks and joins the innovation leaders. These seven economies continue to lead in key innovation indicators. Singapore leads globally (1st) in 14 indicators (Box 1) including Venture capital received, the Republic of Korea in Patents China in High-tech exports, Japan in PCT patents, Hong Kong, China in Market capitalization and Australia in School life expectancy.

Eleven economies within the SEAO region (out of 17 covered) improve their rankings this year, with Indonesia (54th) again making the greatest advance and entering the top 60. Indonesia excels in University–industry R&D collaboration (6th), Policy stability for doing business (13th) and Intangible asset intensity (13th).

Table 4 Heatmap: GII 2024 rankings overall and by innovation pillar, 2024

Economy	Overall GII	Institutions	Human capital and research	Infrastructure	Market sophistication	Business sophistication	Knowledge and technology outputs	Creative outputs
Switzerland	1	3	4	7	5	4	1	1
Sweden	2	16	3	1	9	1	2	6
United States	3	17	12	30	1	2	4	8
Singapore	4	1	2	11	7	3	9	19

Notes: Dark green = 4th quartile (best performers, ranks 1st to 33rd). Light green = 3rd quartile (ranks 34th to 66th). Light orange = 2nd quartile (ranks 67th to 99th). Dark orange = 1st quartile (ranks 100th to 133rd).

Source: Global Innovation Index Database, WIPO, 2024.

The Philippines goes up three ranks to reach the 53rd position. This year it has also attained 3rd position in the lower middle-income group (Table 2). Notable areas in which it excels are trade-related indicators, including High-tech exports (1st globally), High-tech imports (4th), Creative goods exports (14th) and ICT services exports (19th). It has also made advances, albeit at lower levels, in intangible assets, thanks to its strong Global brand value (34th) – and the intangible asset intensity of its companies (35th).

Thailand (41st) and Viet Nam (44th) continue to make advances towards the top 40. Both economies also excel in trade-related indicators. Viet Nam ranks 1st globally in High-tech exports, High-tech imports and Creative goods exports, while Thailand ranks 7th in Creative goods exports and 8th in High-tech exports. Thailand also excels in Utility models (5th) and Domestic credit to private sector (8th), while Viet Nam stands out for its Labor productivity

growth (3rd) and Mobile app creation (7th). Both economies also rank in the top 30 for their global brands, with Viet Nam reaching the 22nd position globally and Thailand the 26th position.

Australia (23rd), Malaysia (33rd) and Mongolia (67th) also move up the ranking.

Central and Southern Asia

Within Central and Southern Asia, India continues to lead, moving one spot forward to the 39th position. India leads the lower middle-income group (Table 2). It holds top ranking within the Central and Southern Asia region for Knowledge and technology outputs (22nd), Creative outputs (43rd), Institutions (54th) and Business sophistication (58th). India's strengths lie in key indicators such as ICT services exports (1st), Venture capital received (6th) and Intangible asset intensity (7th). India's unicorn companies also secure the country the 8th rank globally.

In addition to India, four other economies within the region move up the ranking: Kazakhstan (78th), Sri Lanka (89th), Kyrgyzstan (99th) and Tajikistan (107th). Kazakhstan retains the 3rd place in the region, behind the Islamic Republic of Iran (64th, down by two places). Kyrgyzstan excels in Expenditure on education (3rd), Loans from microfinance institutions (10th) and Low-carbon energy use (13th).

Uzbekistan (83rd) retains its 4th position within the region, with its top performance in Labor productivity growth (7th) and Graduates in science and engineering (12th).

Northern Africa and Western Asia

In Northern Africa and Western Asia, Israel (15th) leads the region, despite moving down one rank this year. It leads in several key innovation indicators, ranking 1st globally in R&D expenditure, Venture capital received, R&D performed by business, ICT services exports and Unicorn valuation.

Türkiye continues to forge ahead, gaining two ranks to reach 37th place. It also takes the 3rd position among the upper middle-income group (Table 2). Türkiye stands out in various areas, notably in Intangible assets (4th), where it ranks 1st globally in Trademarks and Industrial designs, and 9th in Intangible asset intensity – all these indicators showing an improvement this year.

Eight economies within the region move up the ranking. Saudi Arabia (47th) and Qatar (49th) move ahead one spot each, consolidating their positions in the top 50. Georgia moves up to 57th place, entering the top 60, while Armenia (63rd) enters and Morocco (66th) consolidates its position in the top 70. Morocco ranks 1st globally in Industrial designs and ranks in the top 30 on Expenditure on education (20th), Intangible asset intensity (22nd), Gross capital formation (27th), High-tech manufacturing (27th) and Trademarks (30th).

Cyprus (27th) and Algeria (115th) also gain one and four ranks, respectively.

Latin America and the Caribbean

In Latin America and the Caribbean, the regional top 3 remain unchanged: Brazil (50th) retains the top position, followed by Chile (51st) and Mexico (56th). Chile and Mexico improve their positions by one and two ranks, respectively. Chile holds top positions in Tertiary enrolment (7th), Market capitalization (17th) and FDI net inflows (19th). Mexico comes top in trade and high-tech indicators, including Creative goods exports (1st), High-tech exports (11th), High-tech imports (16th) and High-tech manufacturing (15th).

Seven additional economies within the region also improved their ranking: Colombia (61st) – one of the largest jumps in the region, matched only by Paraguay (93rd), Uruguay (62nd), Costa Rica (70th), Peru (75th), Panama (82nd) and Honduras (114th).

Colombia climbs five ranks this year, improving notably in the Innovation Output Sub-Index (62nd). It ranks 18th globally for the valuation of its three unicorn companies, whose joint value

represent about 2 percent of its GDP in 2024. It also leads in Intellectual property payments (11th) and High-tech imports (15th).

Uruguay is the regional leader in Institutions (31st) and Infrastructure (48th), Trinidad and Tobago leads in Human capital and research (37th), and Brazil is top of the region in Business sophistication (39th), Knowledge and technology outputs (50th) and Creative outputs (42nd).

Costa Rica leads in the top 10 in Labor productivity growth (10th) and ICT services exports (10th). Barbados rejoins the GII 2024 at the 77th position, leading globally (1st) in Patent families and PCT patents, and performing in the top 20 in Patents by origin (4th) and Venture capital recipients (16th).

This year, Brazil (50th) and Jamaica (79th) continue to perform above expectation for their level of development (Table 3).

Box 3 Innovation as the driver of the United Nations Sustainable Development Goals

The 2030 Agenda for Sustainable Development, with its 17 Sustainable Development Goals (SDGs), has set an ambitious agenda to drive sustainable development efforts around the world. While technology and innovation are key enablers for the delivery of sustainable and effective solutions to achieve all the SDGs, fostering innovation is integral to SDG 9 “Industry, innovation and infrastructure”, with specific targets that aim to promote the increase of R&D expenditure as a proportion of GDP (9.5.1) and to increase the number of researchers per million inhabitants (9.5.2), both of which are also important GII indicators.³

In this context, the GII has been recognized as an authoritative benchmark for measuring innovation within the 2019, 2021 and 2023 UN General Assembly biennial resolutions on Science, Technology and Innovation for Sustainable Development. The resolution specifically encourages “efforts to increase the availability of data to support the measurement of national innovation systems (such as the existing GII) and empirical research on innovation and development to assist policymakers in designing and implementing innovation strategies”.⁴ This relevance of the GII and WIPO’s work to the SDGs is further amplified by contributions to the ninth annual Multi-stakeholder Forum on Science, Technology and Innovation for the SDGs (STI Forum) held in New York on May 9 and 10, 2024.⁵

Sub-Saharan Africa

In Sub-Saharan Africa, only Mauritius (55th) ranks among the top 60. Three of the region’s other economies rank within the top 90 globally: namely, South Africa (69th), Botswana (87th) and Cabo Verde (90th). Two additional economies – Senegal (92nd) and Kenya (96th) – rank in the top 100. Eight of the region’s economies move up the GII ranking, including Mauritius, Cabo Verde, Senegal, Kenya, Zambia (116th), Benin (119th), Mauritania (126th) and Burundi (127th).

Burundi, Madagascar (110th), Rwanda (104th), Senegal and South Africa are also innovation overperformers this year, with Rwanda’s period of overperformance lasting longest, at 12 years (Table 3). Kenya gains four places and consolidates its place in the top 100. It performs well in Venture capital recipients (13th), Utility models (15th), ICT services exports (17th) and Labor productivity growth (29th).

3 See <https://sdgs.un.org/goals/goal9>.

4 Resolution adopted by the General Assembly on 19 December 2023, 78/160. Science, technology and innovation for sustainable development A/RES/78/160.

5 As part of the Forum’s program, WIPO led an expert conversation on the post-pandemic state of the global innovation system, co-sponsored and co-organized by the Permanent Mission of India to the United Nations, the Confederation of Indian Industry and the Oxford University Saïd Business School; and co-led the organization of the Forum’s dedicated session on gender and STI, focusing on advancing sustainable development with women-centered science and technology solutions, delving into the gender gap in STI and the limited consideration of women’s perspectives in STI solutions. For more on the role of intellectual property in achieving SDGs, see WIPO (2023) and www.wipo.int/sdgs.

Mauritius ranks highest in the region in Institutions (33rd), Human capital and research (69th) and Market sophistication (24th). It leads worldwide in Venture capital received (1st) and ranks 2nd in Venture capital investors. Cabo Verde leads the region in Infrastructure (34th), ranking 1st in Gross capital formation. South Africa tops the region in Business sophistication (57th) and performs well in ICT services imports (18th) and Global brand value (24th).

Senegal leads the region in Knowledge and technology outputs (62nd). It also performs well in Gross capital formation (4th), Unicorn valuation (7th), Loans from microfinance institutions (9th), FDI net inflows (12th) and Venture capital received (22nd).

Finally, Madagascar heads the region in Creative outputs (57th), performing well in Industrial designs (14th) and Trademarks (21st), both of which show improvement this year.

Conclusion

The latest GII rankings highlight the following points:

- There have been shifts within the world's top innovators. Within the top 10, the top 3 remain unchanged, while Singapore and the Republic of Korea advance. China – the only middle-income economy among the innovation leaders – bounces back to 11th position, edging closer to the top 10 once again (after having dropped back by one place last year). Within the top 25, Canada, Austria, Ireland, Luxembourg, Australia and New Zealand ascend, with Ireland and Luxembourg entering the top 20, and New Zealand the top 25.
- Europe still hosts the highest number of economies in the top GII ranking echelons – seven in the GII top 10 and 15 in the GII top 25.
- A small number of leading innovative middle-income economies are showing remarkable progress in their innovation performance.
 - China remains the frontrunner, but other key players previously identified by the GII, such as Indonesia (54th) (entering the top 60), the Philippines (53rd), Türkiye (37th), Viet Nam (44th) and India (39th), ordered by their rank progression in 2024, are also all climbing the ranks. Thailand (41st) is demonstrating increased potential, nearing the top 40 – its best rank since 2009 – and sustaining its progression over the long run. Additionally, Morocco (66th) has emerged as one of the fastest climbers within the top 70 since 2013. These middle-income economies, despite some of them suffering setbacks in their performance in the GII 2021 and 2022 (e.g. Viet Nam, the Philippines and Indonesia), exhibit resilience and strategic long-term focus on innovation, even amid the challenges posed by the economic recovery from the COVID-19 pandemic. Moreover, these economies share common traits: they are all Asian economies; they are emerging markets with potential for rapid growth due to industrialization, urbanization and globalization; all have diverse economic structures; and they are heavily integrated in global value chains and high-tech trade.
 - Other economies have also demonstrated great progress over the long term, albeit at lower rankings, sustaining their rank increases since 2013. This group, which demonstrates high potential – despite some short-term setbacks, includes notable long-term, climbers Uzbekistan (83rd), the Islamic Republic of Iran (64th), Pakistan (91st), Madagascar (110th) (the only low-income economy in this group), Bangladesh (106th) and Egypt (86th) (ordered by their rank progression since 2013).
- With no new additions, this year 19 economies are performing above expectation relative to their level of development. Indonesia, Pakistan and Uzbekistan have maintained their overperformer status for the third consecutive year, indicating a potentially sustainable positive trend.
 - In contrast, 41 economies are performing below expectation in 2024, most of which are in Latin America and the Caribbean and Sub-Saharan Africa.
 - More middle- and low-income economies would benefit from a systematic and gradual improvement of the set-up and performance of their innovation ecosystem.

- Nine economies in Latin America and the Caribbean have risen in the ranking, including top regional performers Chile and Mexico. While these advancements are undoubtedly positive, this year's results indicate that, on average, other world regions, such as Central and Southern Asia, will soon overtake Latin America and the Caribbean in terms of innovation performance. This should serve as a call to action for policymakers in Latin America and the Caribbean to sustain and enhance their long-term innovation efforts.
- In Sub-Saharan Africa, Mauritius remains the highest ranking economy, while eight economies, including Kenya and Senegal, have moved up the GII ranking in 2024. Madagascar, Côte d'Ivoire (112th) and Togo (117th) have made the greatest advances in the region since 2013. However, large economies, such as South Africa (69th), Nigeria (113th) and Ethiopia (130th) have lost ground in the ranking this year, and most of them (with the exception of Kenya) have not been able to sustain their rank progression over time.

The GII will continue to monitor the evolving innovation landscape. The dynamic ecosystems observed in key middle-income economies showcase remarkable resilience and strategic prioritization of innovation. The GII will persist in providing robust data and insights to inform evidence-based policymaking, ensuring that both high-income and emerging economies can navigate and bridge the innovation gap effectively.

Cluster ranking

The GII reveals the world's top 100 science and technology (S&T) clusters and identifies the most S&T-intensive top global clusters.

The GII 2024 top 100 science and technology clusters

The Global Innovation Index (GII) ranks the world's leading economies according to their innovation capabilities. A common thread among top-performing nations is the presence of thriving science and technology (S&T) clusters. Since 2016, the GII has employed a bottom-up approach to identifying such clusters. This methodology disregards administrative or political borders and instead pinpoints those geographical areas with a high density of inventors and scientific authors. The resulting clusters identified in this way often span several municipal districts, sub-federal states, and sometimes even two or more countries.

Two innovation metrics are used to compile the top 100 GII S&T clusters worldwide (see methodological Appendix IV for details). The first metric focuses on the location of inventors listed in published patent applications under the WIPO Patent Cooperation Treaty (PCT).¹ The second metric considers the authors listed on published scientific articles.

S&T clusters – which can be entire regions or cities – serve as the backbone of a robust national innovation ecosystem. Situated in areas such as San Francisco's Silicon Valley, Cambridge, Munich and Paris in Europe, or Bengaluru, Seoul, Shenzhen and Tokyo in Asia, these S&T clusters are home to renowned universities, brilliant scientists, R&D-intensive companies, and prolific inventors. It is the collaboration among these entities that results in the groundbreaking scientific advancements and inventions that propel national, regional and global innovation forward.

The GII recognizes the significance of these regional hubs and charts annually the world's top 100 S&T clusters (Map 1). These areas boast the highest density of inventors and scientific authors globally.

The GII 2024 also presents S&T clusters beyond the top 100 in order to shed light on other areas around the world with an appreciably high level of science and technology. In addition, the GII 2024 takes a first step toward highlighting S&T clusters within Africa, a region whose output is typically not taken account of when clustering at the global level.

Lastly, to complement this section of the GII, a series of “Top Clusters Briefs” (link) provide further details on top ranking hotspots. This complements other work undertaken by WIPO to better measure and understand sub-national innovation activity (de Rassenfosse, G. and S. Wunsch-Vincent, 2024).²

Tokyo–Yokohama plus six other Asian and three US clusters lead the top 100 S&T clusters

Among the top 100 S&T clusters, Tokyo–Yokohama (Japan) is the top performing cluster, followed by Shenzhen–Hong Kong–Guangzhou (China and Hong Kong, China). Both clusters rank one and two owing to having a large output of PCT applications, thanks in great part to patents filed by Mitsubishi Electric located in Tokyo–Yokohama and Huawei located in Shenzhen–Hong Kong–Guangzhou, respectively. When combined, Tokyo–Yokohama and Shenzhen–Hong Kong–Guangzhou account for almost one in every five PCT applications filed globally.

Beijing (China), Seoul (Republic of Korea) and Shanghai–Suzhou (China) follow, ranking 3rd, 4th and 5th, respectively. Beijing (China) reclaims third spot in the rankings, overtaking Seoul (Republic of Korea) in fourth, in 2024. Shanghai–Suzhou (China) is in the top 5, primarily owing to

1 The WIPO Patent Cooperation Treaty (PCT) assists applicants in seeking patent protection internationally for inventions, helps patent offices with patent granting decisions, and facilitates public access to a wealth of technical information relating to those inventions. By filing one international patent application under the PCT System, applicants can simultaneously seek protection for an invention in a large number of countries (<https://www.wipo.int/pct/en>).

2 See Box 2 in GII 2024 Results and “WIPO General Assemblies 2024 – Side Event Global Innovation Index: Measuring and Promoting Sub-national Innovation Performance: The Role of Regional Innovation Indices,” July 12, 2024, and “Workshop – Global Innovation Index Sharing of Experiences in the Creation & Implementation of Regional Innovation Indices,” June 7, 2022.

a strong growth in PCT filings. San Jose–San Francisco, CA (United States of America (US)) follows in 6th position.

Map 1 Top 100 clusters worldwide, 2024

Note: Noise refers to all inventor/author locations not classified as being within a cluster.

Source: WIPO Statistics Database, April 2024.

The four remaining top 10 clusters are unchanged from the previous year, with the exception of Nanjing (China), replacing San Diego, CA (United States), which is 10th and New York City, NY, which is now 11th. Nanjing's growth was spurred by its scientific article output, primarily from authors affiliated with Southeast University and Nanjing University.

This year five clusters entered the top 100 for the first time. Nanchang (China) located in the eastern part of Jiangxi Province secures the 94th position. Cairo (Egypt) enters the top 100 ranked 95th. This marks the first time that a Northern African cluster is represented within the top 100 S&T clusters. Following closely behind Cairo's entrance are two Chinese clusters entering the top 100 for the first time: Kunming, the capital of Yunnan Province China (98th), and Macao Special Administrative Region of China–Zhuhai (Macao SAR–Zhuhai) (100th).

For Nanchang (Nanchang University), Cairo (Cairo University) and Kunming (Kunming University of Science and Technology), their total output was primarily in the form of scientific articles, which experienced strong growth in all three clusters and is the reason for their entry into the top 100. Macao SAR–Zhuhai's primary output is PCT patents, thanks in large measure to the presence of GREE Electric Appliances, which accounts for almost half of Macao SAR–Zhuhai's applications. Similarly to the other three newcomers to the top 100, the driver behind Macao SAR–Zhuhai's increased standing in the ranking is a growth in published scientific articles.

Kuala Lumpur (Malaysia) ranked 93rd also appears in the top 100 S&T clusters for the first time. Kuala Lumpur achieved this status thanks to improved geocoding accuracy assigning more author and inventor locations to that city.³ MIMOS (Malaysia's National Applied Research and Development Centre) is Kuala Lumpur's top patent applicant and active in semiconductor research, and the Universiti Malaya the top publishing organization.

Clusters within China once again demonstrated significant increases in S&T output in 2024. China hosts the two fastest growing clusters globally – Hefei (+22.7 percent) and Zhengzhou (+18.9 percent).⁴ Hefei's growth was driven by a strong PCT applications growth, and in particular the growth of applications filed by ChangXin Memory Technologies headquartered

³ See the methodological Appendix IV.

⁴ Net S&T output refers to a change in combined output of both components (PCT filings and SCIE articles) over time.

in Hefei. Zhengzhou's rapid growth was instead driven by the number of scientific articles published, the largest contributor being Zhengzhou University.

Clusters located in other middle-income economies besides China also experienced strong S&T output growth. Cairo (Egypt) had the highest growth rate for this group at 10.9 percent. Chennai (India) with 7.8 percent and Istanbul (Türkiye) with 7.5 percent also had a high rate of growth for this group.

High-income economy clusters generally grew at a slower pace than clusters in middle-income economies, with 37 out of the 63 high-income clusters witnessing negative net S&T output for the period. Nevertheless, notable exceptions to this trend exist among high-income economy clusters. Daejeon (Republic of Korea, +6.9 percent), Seoul (+4.1 percent) and San Diego, CA (+4.2 percent) once again had strong growth years. Warsaw (+3.1 percent) in Poland also experienced strong growth.

The top S&T clusters for each economy or cross-border region are shown in Table 5. The leading clusters per country remain unchanged from last year, except for Sydney overtaking Melbourne to become the leading Australian S&T cluster, with the University of Sydney publishing the most scientific articles and Cochlear, the medical device company, filing the most patent applications. It is notable that Samsung Electronics (Republic of Korea) is also the leading patentee in Bengaluru, Moscow and Warsaw (beyond Seoul).

Table 5 Top S&T cluster by economy or cross-border region ranked among the top 100, 2024

Rank	Cluster name	Economy	Rank change	Top applicant	Top organization
1	Tokyo–Yokohama	JP	0	Mitsubishi Electric	University of Tokyo
2	Shenzhen–Hong Kong–Guangzhou	CN/HK	0	Huawei	Sun Yat Sen University
3	Beijing	CN	1	BOE Technology	Tsinghua University
4	Seoul	KR	–1	Samsung Electronics	Seoul National University

China and the United States have the most S&T clusters in the top 100 S&T

In 2024, as in previous years, the top 100 S&T clusters continue to be predominantly located in three regions: North America, Europe, and Asia, with a particular concentration in two key economies: China and the United States (see Map 1).

Table 6 Economies with three or more top 100 S&T clusters, 2024

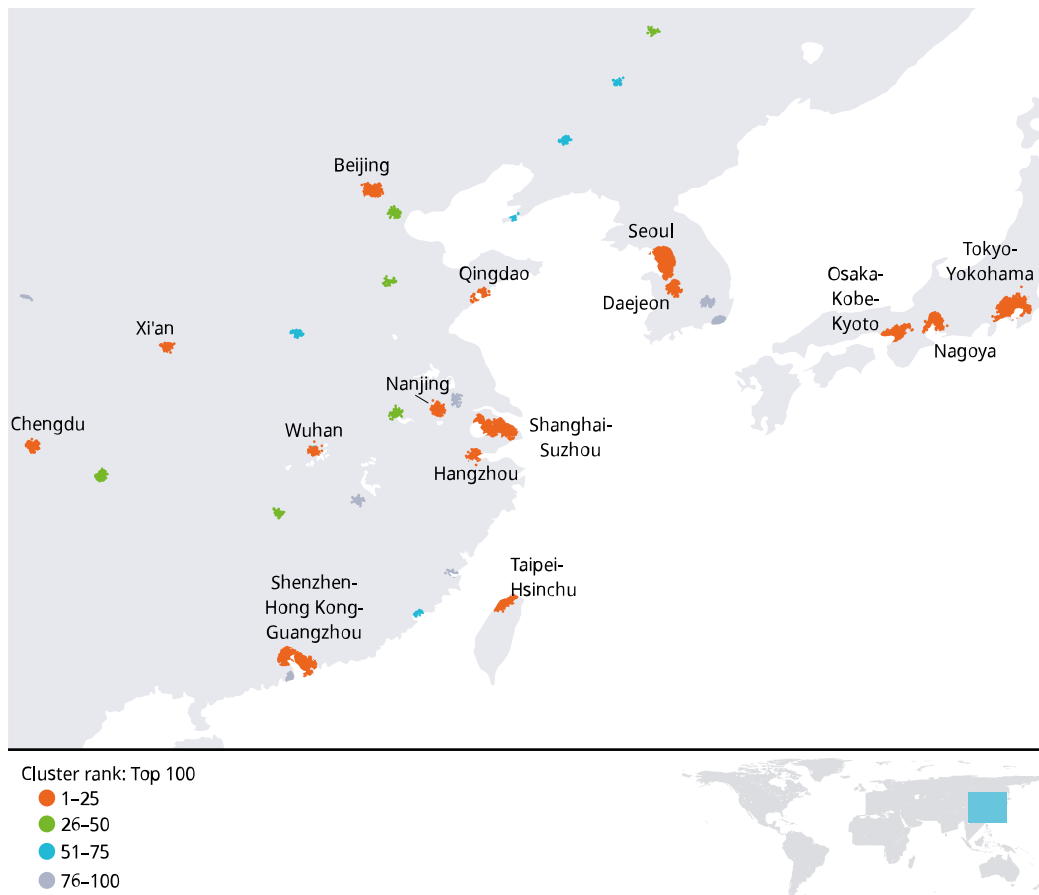

Source: WIPO Statistics Database, April 2024.

China, for the second consecutive year, leads with the most clusters (26) in the top 100 (Map 2). The United States follows closely behind with 20 clusters. Germany ranks third with eight clusters in the top 100, with Munich (22nd), Cologne (27th) and Stuttgart (29th) its top three clusters. India, with its top cluster of Bengaluru (56th) in southern India, and the Republic of Korea both have four clusters in the top 100. France, the United Kingdom (UK), Japan and Canada each have three clusters in the top 100. Paris (12th) leads France's ranking, while London (21st) represents the United Kingdom's top cluster. Canada's top cluster is Toronto, Ontario (54th).

In addition to China, seven other middle-income economies have clusters among the top 100. They are:

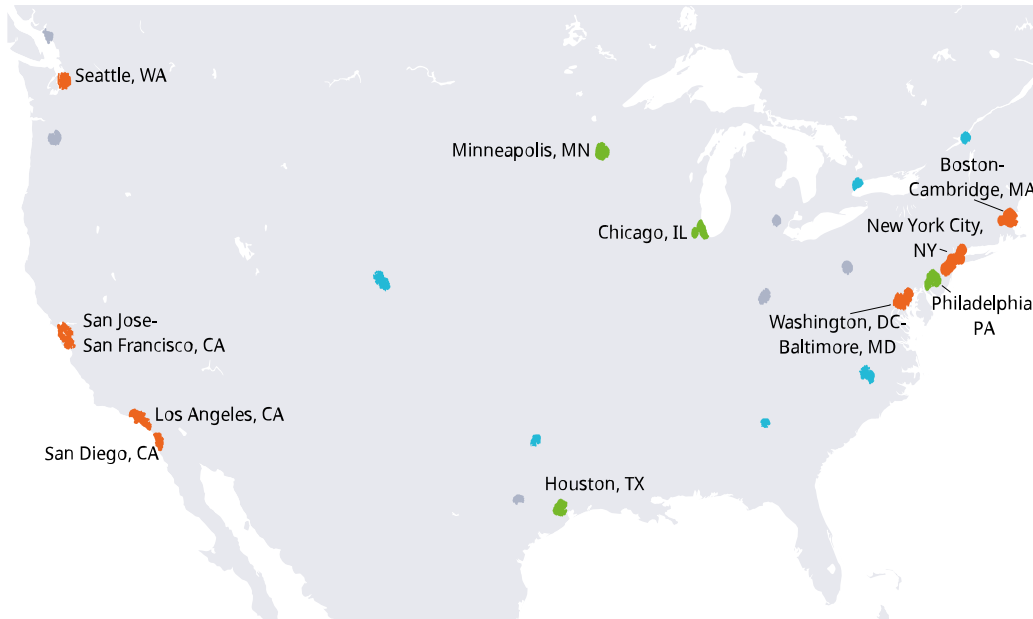

- Brazil (1 cluster), with São Paulo, the sole top 100 S&T cluster within Latin America;
- Egypt (1), with Cairo, the sole top 100 S&T cluster within Africa (see Map 2);
- India (4), with Bengaluru, Delhi, Chennai and Mumbai;
- Islamic Republic of Iran (1), with Tehran;
- Malaysia (2), with Kuala Lumpur and its cross-border clusters shared with Singapore (see Map 2);
- Russian Federation (1), with Moscow; and
- Türkiye (2), with Istanbul and Ankara.

Beyond the top 100, Bangkok, Buenos Aires, Cairo, Kuala Lumpur and Mexico City are top middle-income economy S&T clusters

Based on the same parameters applied to produce the top 100 ranking S&T clusters globally, an additional 132 clusters were identified beyond the top 100, including 24 clusters based in the United States, 15 in China and 11 in each of France and Germany.

Table 7 identifies top S&T clusters in economies not previously represented in the top 100, including Portugal and Saudi Arabia, which each had two clusters.

Middle-income economies Argentina, Mexico, Pakistan, Serbia and Thailand all host a top S&T cluster in the extended list, namely, Buenos Aires, Mexico City, Islamabad, Belgrade and Bangkok, respectively.

Table 7 Top S&T clusters in extended ranking, economies not covered by the top 100 S&T clusters, 2024

Economy	Economy name	Clusters beyond top 100	Cluster name(s)

Top science or S&T clusters in Africa

The GII 2024 has sought to identify the top S&T clusters within Africa that would not otherwise have been captured by the GII methodology determining the global 100 top S&T clusters.

To begin, a similar clustering methodology used at the global level was applied to authors and inventors located within the region of Africa. By lowering the density parameter sufficiently (see Appendix IV for more details), the top 50 African clusters were identified (Map 3 and Table 7 for the results).

In addition to Cairo, which has already been highlighted as a GII S&T top 100 ranking cluster, Johannesburg (South Africa), Cape Town (South Africa), Tunis (Tunisia) and Alexandria (Egypt) comprise the top 5 S&T clusters within Africa.

Egypt has the most clusters (11, with Cairo leading), followed by South Africa (8, with Johannesburg leading), Morocco (5, with Rabat leading), Nigeria (4, with Ibadan leading), Tunisia (4, Tunis leading), Ethiopia (2, with Addis Ababa leading), Ghana (2, with Accra leading), Kenya (1, with Nairobi leading), followed by Algeria, Benin, Burkina Faso, Cameroon, the Congo, Côte d'Ivoire, the Democratic Republic of the Congo, Malawi, Senegal, Sudan, Uganda, the United Republic of Tanzania, Zambia and Zimbabwe with each one cluster. Appendix Table 6 shows the top patentees and publishing organizations for said clusters, with the majority of top institutions active in medical technology, and civil engineering, for example.

It is noteworthy, that many, but not all, African clusters are primarily driven by scientific articles and not PCT patenting activity. Hence in certain cases it is more appropriate to label them as African top science clusters, rather than African S&T clusters. That said, it would be wrong to assume that African S&T clusters do not patent at all. Firstly, the clusters in Egypt, South Africa, Morocco, and Tunisia, but also Algeria and Kenya, show significant international patent filing activity. Secondly, it is useful to recall that the GII methodology to determine top S&T clusters only captures patents filed under the PCT System. PCT patents tend to be patents that seek protection in more than one jurisdiction, and therefore does not include the more numerous set of patents that only seek protection in a single jurisdiction, usually the applicants domestic jurisdiction (national patents). While some clusters have modest PCT filing activity as of yet, these same clusters often still show healthy domestic patenting activity. Future editions of the

GII will unpack some such clusters in greater detail, including for other world regions in addition to Africa.

S&T intensity of the top 100 clusters: Europe and the United States occupy the top 5 spots, with Cambridge (United Kingdom) and San Jose–San Francisco, CA (United States) out in the lead

Since 2020, the GII has also presented the top 100 clusters ranked by S&T intensity. This ranking is based on the sum of patent and scientific publication shares divided by population. This work draws on geospatial imagery in order to estimate the underlying population level (see Appendix IV).

Table 9 Top 25 S&T clusters by S&T intensity, 2024

Rank per-capita	Cluster name	Economy	Top applicant	Top scientific organization
1	Cambridge	GB	ARM	Cambridge University
2	San Jose–San Francisco, CA	US	Google	Stanford University
3	Eindhoven	NL	Philips Electronics	Eindhoven University of Tech.
4	Oxford	GB	Oxford University	Oxford University
5	Boston–Cambridge, MA	US	MIT	MIT
6	San Diego, CA	US	Qualcomm	University of California San Diego
7	Daejeon	KR	LG Chem	KAIST
8	Ann Arbor, MI	US	University of Michigan	University of Michigan

Cambridge in the United Kingdom and San Jose–San Francisco, CA, in the United States were the two most S&T-intensive clusters, globally, followed by Eindhoven (Kingdom of the Netherlands), Oxford (United Kingdom), and Boston–Cambridge, MA (United States) (Table 9).

Cambridge's position as the top cluster by S&T-intensiveness was once again thanks to the presence of Cambridge University and central processing unit (CPU) maker ARM. Cambridge produced the most articles per capita, at just over 35,000 per one million people (see Appendix Table 4). San Jose–San Francisco, CA, leads on PCT filings per capita, producing roughly 7,900 per one million people, followed by Eindhoven, with 7,536 per million.

There are three clusters among both the global top 10 and the top 10 for intensity, all in the United States: San Jose–San Francisco, CA; Boston–Cambridge, MA, and San Diego, CA.

Daejeon (Republic of Korea) is the highest-ranking Asian S&T cluster by intensity

When viewed with a focus on intensity, many clusters within Europe and North America display a higher level of S&T activity compared to their Asian counterparts. Twelve of the top 25 clusters by intensity are located within Europe. North America had eight clusters in the top 25 by intensity and Asia had five clusters, which is markedly different than the 15 clusters in the global top 25 that were located in Asia (Map 4 and Table 9). Asia's top cluster by intensity was Daejeon (Republic of Korea) ranked 7th, owing to the presence of LG Chem and LG Energy Solutions. Daejeon was followed by the much larger metropolises of Beijing (China) ranked 11th (up from 14th last year), and Tokyo–Yokohama ranked 15th (up from 17th last year). A new entrant to the top 25 for China was Qingdao, with Qingdao Haier Air Conditioner being the top patentee and Qingdao University the top publishing organization.

Special Theme 2024: Unlocking the Promise of Social Entrepreneurship

This year's special GII theme looks to the future of social entrepreneurship and asks: What will it take for social entrepreneurship to catalyze transformative innovation and societal impact?

This chapter was written by **Marya Besharov and Kevin Miner, Skoll Centre for Social Entrepreneurship, Saïd Business School, University of Oxford and Anmol Kaur Grewal and Sacha Wunsch-Vincent, WIPO¹.**

As part of a broader trend toward innovation with more direct social impact, new social entrepreneurial ventures and start-ups have proliferated in recent years.

Social entrepreneurs set out to develop and fund solutions that directly address social issues with impact on communities, societies, and the world at large while trying to generate revenue by operating within the confines of the market economy.

For many young inventors and innovators, social entrepreneurship offers a chance to align their work with the desire to create positive change in their communities and the world at large. By addressing issues affecting people and places often overlooked by business and government due to misaligned incentives or priorities, social entrepreneurship holds immense potential to generate above-average social returns through the promotion of innovation in the areas that need it most.

Traditional innovation models and ecosystem studies have thus far turned a blind eye to these forms of socially motivated, community-based, and localized innovation models.² As a result, innovation policy has not been optimally designed to support social entrepreneurship.

To address these issues, this 2024 edition of the *Global Innovation Index* (GII), with in-depth case studies and contributions by experts ([available online](#)), puts the spotlight on social entrepreneurship, addressing three critical questions for unleashing the potential of this promising new phenomenon:

- What is the state of social entrepreneurship globally?
- How do social enterprises create positive impact, and what role does innovation play?
- How can policy help to unlock the promise of social entrepreneurship?

The state of social entrepreneurship

Today, social entrepreneurship is a major economic and social force on the global stage, as entrepreneurs develop innovative business models to address some of the world's most pressing economic, social and environmental problems. Current estimates suggest there are 10-11 million social enterprises and up to 30 million social entrepreneurs around the world, contributing roughly \$2 trillion to global GDP (Schwab Foundation for Social Entrepreneurship and World Economic Forum, 2024; British Council and Social Enterprise UK, 2022).

These organizations tackle poverty, helping millions of people globally build sustainable livelihoods through education, training, and employment; they address environmental devastation, developing renewable sources of energy and working with companies to reduce emissions; and they combat racial and social injustice, working to shift cultural norms and organizational practices to ensure previously marginalized groups have full access to economic and social opportunities, among many other issues.

1 This report draws in part on Hanna Hottenrott's Background study for the GII 2024 Special theme, "An economic perspective on social entrepreneurship: Insights and policy implications," Technical University of Munich (TUM) and Leibniz Centre for European Economic Research (ZEW), June 2024, as well as 14 cases studies of social entrepreneurs by Cynthia Rayner and the WIPO and Skoll Centre Workshop: A Conversation on the State of Social Entrepreneurship, held on April 12, 2024, as part of the 2024 Skoll World Forum. Jeroo Billimoria, Soumitra Dutta, Johanna Mair, Alex Nicholls and Cynthia Rayner provided useful comments on earlier drafts. We thank Menna Clark and Jessica Jacobson from the Skoll Centre team for design and administrative support.

2 For earlier work on innovation in the informal economy, see Kraemer-Mbula and Wunsch-Vincent (2016).

Defining social entrepreneurship

Definitions of social entrepreneurship vary widely around the world, reflecting the diversity of legal systems, regional histories, and financing and policy environments in which social entrepreneurs operate (GII 2024 Expert contribution from Kraemer-Mbula).³ In this report, we define social entrepreneurship as the process of developing and implementing innovative organizational models to address social and/or environmental challenges, without profit as the primary purpose (see GII 2024 Expert contribution from Dey and Gupta on the nuance between social enterprise and social business).

Because they pursue social and/or environmental purposes through organizational models that often involve commercial activity, social enterprises are hybrids that blur traditional boundaries between the social sector and the market (Dees, 1998; Martin and Osberg, 2003; Smith *et al.*, 2013). As a result, they frequently face competing demands between social impact versus financial success, beneficiaries versus investors, and long-term systemic change versus short-term organizational survival. If not managed effectively, these competing demands can create internal tensions and lead to performance decline (Battilana and Dorado, 2010).

At the same time, competing demands are also the source of social entrepreneurship's innovation potential: that is to say, novel creative solutions emerge when aspects of different institutional worlds – in this case the social sector and the market – are brought together (Smith and Besharov, 2019).

To harness this innovation potential, social enterprises develop governance models, organizational structures, leadership practices, human resources policies and stakeholder relationships that focus attention on the social mission without sacrificing financial viability (Pache, Battilana and Spencer 2024; Smith and Besharov, 2019 ; Mitzinneck and Besharov, 2019; Battilana *et al.*, 2015; Battilana and Dorado, 2010). And they deploy this innovation potential to address a wide range of global challenges, of which economic opportunity is the most common, followed by issues of environment, health, education and inequality (Table 10).

3 See also Bacq and Janssen, 2011; Choi and Majumdar, 2014; Mair and Noboa, 2006; Ran and Weller, 2021; Weerawardena and Mort, 2006.

Table 10 Top 5 issues addressed by social entrepreneurship globally

Issue	Example
Economic opportunity	<p>Bandhu</p> <p>Bandhu is an India-based for-profit social enterprise delivering an AI-enhanced mobile technology platform that aggregates supply and demand for low-income migrant housing. They also train and contract with on-the-ground women community “champions” in order to increase the housing supply for interstate migrant workers.</p> <p>Bandhu’s field and technology teams communicate in a constant feedback loop, with insights from community champions and migrant workers used to improve platform features. Bandhu also works in close partnership with engineering teams from other firms in open-source development partnerships to better understand how to provide for an underserved and understudied population.</p> <p>So far, 160,000 people have accessed the Bandhu platform in order to browse housing opportunities, and 60,000 workers have secured housing.</p>
Environment	<p>Green Bio Energy (GBE)</p> <p>GBE is a Uganda-based producer of eco-friendly, carbonized briquettes made from recycled materials. In addition to producing and distributing eco-friendly fuel and appliances, GBE provides consulting services to micro-entrepreneurs seeking to build a market for eco-friendly energy alternatives.</p> <p>As part of its model, GBE mobilizes community members to join the supply chain, particularly in waste collection and manufacturing efforts that support briquette production. GBE also invests in customer education explaining the health, economic, and environmental benefits of using their briquettes over charcoal.</p> <p>GBE currently serves 1,000 customers, with annual sales of 600 tons of briquettes, offsetting over 8,760 tons of CO2 emissions.</p>
Health	<p>Peek Vision</p> <p>Peek Vision partners with governments, non-governmental organizations (NGOs) and large eye health providers across Africa and Asia to provide mobile eye-health screening and referrals that can be delivered in low-resource settings by non-specialists. It also offers a comprehensive data intelligence platform that helps service providers optimize eye health coverage across hard-to-reach populations.</p> <p>Peek’s innovative mobile eye screening and referral technology has been specifically designed to be accessible to non-specialist community workers, bringing services to populations in remote areas at lower costs. Using Peek reduces costs per patient by up to six times compared to a standard eye health program.</p> <p>Programmes using Peek have screened over 8 million people, identifying nearly 1.6 million with eye health needs and connecting more than 840,000 people with care. Peek now screens 100,000+ people every week.</p>
Education	<p>Thaki</p> <p>Thaki is a social enterprise operating primarily in Lebanon and Jordan. The organization receives and refurbishes second-hand devices – mainly laptops – and loads them with offline learning content for distribution to NGO partners and schools in refugee and vulnerable host communities. Thaki also develops digital literacy training for teachers and has co-developed a digital social-emotional learning program for young children.</p> <p>Recognizing the unique needs of refugee schools, Thaki ensures that educational content can be delivered regardless of circumstances. Internet service is not required in order to access content on Thaki devices; and they have partnered with solar power providers to deploy off-grid electricity solutions for schools.</p> <p>To-date, Thaki has distributed over 5,800 devices to 157 education partners, serving more than 33,000 students.</p>
Inequality	<p>Community Design Agency (CDA)</p> <p>CDA is an India-based design and architecture social enterprise that meaningfully involves low-income communities in the process of transforming existing public housing and designing new housing communities and workplaces. Their approach preserves the social fabric and empowers marginalized, low-income residents by creating quality and climate resilient neighborhoods.</p> <p>Through innovative participatory processes with local citizens, CDA co-designs spaces tailored to the unique needs of often-neglected communities. CDA also collaborates with local and international partners to explore the viability of new blended financing models for local housing and neighborhood improvement initiatives.</p> <p>CDA has thus far worked across four cities and leveraged nearly USD 1 million in public subsidies through its initiatives in slum redevelopment and neighborhood regeneration, directly and indirectly impacting over 25,000 lives.</p>

Source: Authors' own representation based on data from EUCLID Network, 2022, British Council and Social Enterprise UK, 2022; Catalyst 2030 Annual Membership Survey 2023 data provided to the Authors; Social Enterprise UK, 2023.

Reflecting the diversity of issues addressed, social entrepreneurship is thriving across sectors, including agriculture, education, financial services and energy (see GII 2024 Background study from Hottenrott). Recently, social entrepreneurship has gained increased attention in the health care sector, particularly as COVID-19 highlighted serious inequities and gaps in the services provided by the market and public sectors (see GII 2024 Expert contribution from Kraemer-Mbula). As the global economy increasingly embraces high technology, including artificial intelligence (AI), data analytics, fintech and more, social entrepreneurship is venturing into these areas as well (see GII 2024 Expert contribution from Kraemer-Mbula; GII 2024 Case study contribution from Rayner on Bandhu, Fairtrasa, iKure, Peek Vision, and WeRobotics).

The origins of social entrepreneurship

Perhaps it is unsurprising that there is not yet a uniform definition of social entrepreneurship, the term itself being relatively new. It first emerged in the late 20th century to describe the innovative work being done by a new wave of leaders who sought to address complex social and environmental challenges by combining aspects of business and non-profit organizations (Nicholls 2008; Bornstein and Davis, 2010; Zahra and Wright, 2016; Stephan, Uhlaner and Stride, 2015). This “hybrid” approach to addressing social issues started to spread in the early 2000s, with steadily increasing media mentions and a growing number of social enterprises over the subsequent two decades (Litrico and Besharov, 2019).

While social entrepreneurs themselves played a significant role in this growth, they were not alone; the development of the field was the product of active work undertaken by a diverse set of actors promoting innovation and entrepreneurship as a means of addressing complex social problems (Nicholls, 2010).

Alliances and networks formed in the early days of social entrepreneurship to share visions and business models and advocate for legal, policy and financial change in support of these new kinds of ventures. Ashoka, founded in 1980, is widely recognized as one of the first networks established to support social entrepreneurs globally. It created a community where knowledge and experience were freely shared, and collective advocacy was harnessed in order to incubate new social entrepreneurs and scale existing work.

Another early pioneer, the Bangladesh Rural Advancement Committee (BRAC), a development organization formed in 1972, has operated, resourced and advocated for social enterprises in Asia for decades.

More recently, Catalyst 2030 was launched at the World Economic Forum in 2020 to catalyze collaboration in the fragmented community of social enterprises, governments, corporations and universities globally, and leverage their collective power so as to accelerate progress toward achieving the United Nations Sustainable Development Goals (SDGs) (see GII 2024 Expert contribution from Billimoria on the critical role of alliances and networks; Catalyst 2030, 2022).

Philanthropic foundations interested in sustainable and scalable social interventions and services were also pivotal to the rise of social entrepreneurship. Starting in the late 1980s and continuing through to the present day, organizations such as Echoing Green (1987), the Schwab Foundation for Social Entrepreneurship (1998) and the Skoll Foundation (1999) have operated award or fellowship programmes designed to recognize and promote individual social entrepreneurs. Through events such as the Skoll World Forum, which brings social entrepreneurs together alongside philanthropic leaders, government leaders, academics, and other partners, these funders have proved influential in establishing a global ecosystem of social entrepreneurs.

Government supporters also played a role, tapping into the innovative solutions presented by social enterprises aimed at addressing persistent social and environmental problems. The United Kingdom (UK) was one of the earliest adopters of a policy strategy on social entrepreneurship, establishing a dedicated Social Enterprise Unit in 2001 tasked with the goal of building a network of stakeholders and identifying barriers facing the community (Stumbitz *et al.*, 2019, chapter 1). In 2007, the Republic of Korea passed one of the most comprehensive pieces of legislation in Asia, the Social Enterprise Promotion Act, which established the Korea Social Enterprise Promotion Agency (KoSEA) to support social enterprise commercialization

and networks.⁴ More recently, international bodies like ASEAN, the Organisation for Economic Co-operation and Development (OECD), the African Union and the European Union (EU) have all promoted social entrepreneurship (see GII 2024 Expert contribution from Klijn and Bonnici).

Universities and professional associations have launched academic centers, dedicated journals and conferences on which to build a research base on social entrepreneurship and disseminate insights regarding the impact of social entrepreneurship on communities, environments and economies. Academic centers dedicated to social entrepreneurship, innovation and impact were formed, starting in the early 2000s, often at business schools.⁵ Some of these academic centers were established with the support of philanthropic foundations.⁶

Why is social entrepreneurship important now?

Today, social entrepreneurship is recognized for its ability to address mounting global social and environmental challenges threatening lives and livelihoods, especially those of the most marginalized. Two decades of research has demonstrated the effectiveness of social entrepreneurship in alleviating poverty and other complex challenges.⁷ Additionally, in an era of globally high youth unemployment and dissatisfaction with work, social entrepreneurship offers a unique opportunity to educate and engage young people in addressing the societal issues they care about, while at the same time developing local and regional economies (see GII 2024 Expert contribution from Çiftçi).

These positive impacts have garnered the world's attention. International agencies, including the United Nations, the OECD, the International Labour Organization (ILO), the World Intellectual Property Organization (WIPO), as well as local and national governments and academic institutions, have recognized the potential of and calling for greater support for social entrepreneurship. In 2023, for example, the United Nations General Assembly passed a pivotal resolution (United Nations General Assembly, 2023, Res. 77/281) acknowledging the importance of social entrepreneurship and urging member states and financial institutions to bolster their support, stating: "Social entrepreneurship, including cooperatives and social enterprises, can help to alleviate poverty and catalyse social transformation by strengthening the productive capacities of those in vulnerable situations and producing goods and services accessible to them."

Critics have, however, argued that social entrepreneurship could crowd out government activity, emboldening governments to reduce the provision of critical services and rely instead on a patchwork of social enterprises to fill any gaps (Ganz, Kay and Spicer, 2018; Giridharadas, 2018). Indeed, there is evidence to suggest that, as some governments scaled back welfare programmes in the late 20th and early 21st centuries, social enterprises, along with associations, non-profit organizations and cooperatives, stepped in to fill these voids (see GII 2024 Expert contribution from Dey and Gupta).⁸

But recent research has also shown that social enterprises can be effective in highlighting deficiencies in existing public and market solutions and in catalyzing innovative public and private activity to address long-term, systemic challenges.⁹ Social entrepreneurs often collaborate with governments and private enterprises to build lasting solutions to pressing challenges. Tebita Ambulance, for example, an Ethiopia-based social enterprise, has collaborated with policymakers to establish and advance emergency medical service standards in Addis Ababa. Kibret Adebbe, a social entrepreneur with years of medical expertise and founder

4 See Korea Social Enterprise Promotion Agency. Available at: https://www.socialenterprise.or.kr/_engsocial/?m_cd=0101

5 Examples include the Social Enterprise Initiative at Harvard Business School in 1993, Center for the Advancement of Social Entrepreneurship (CASE) at Duke University in 2002, and the Skoll Centre for Social Entrepreneurship at Saïd Business School, University of Oxford in 2003. For instance, the Skoll Foundation supported the founding of the Skoll Centre for Social Entrepreneurship at Saïd Business School, University of Oxford, to help further grow the field through education and research.

6 For instance, the Skoll Foundation supported the founding of the Skoll Centre for Social Entrepreneurship at Saïd Business School, University of Oxford, to help further grow the field through education and research.

7 For example, on poverty alleviation, Tobias *et al.*, 2013; Sutter *et al.*, 2019; Ghauri *et al.*, 2014; on promoting gender equity, Datta and Gailey, 2012; Haugh and Talwar, 2016; on combatting climate change, Calic and Mosakowski, 2016.

8 See also OECD, 2003; Defourny and Nyssens, 2010.

9 For examples, see Lechterman and Mair, 2024; Mair and Rathert, 2024; Savaget *et al.*, 2024.

of Tebita Ambulance, worked closely with the Addis Ababa Health Bureau to build the country's first emergency medical service standards and licensing system in 2007. This groundbreaking work allowed Tebita Ambulance to become the country's first private emergency medical services company and set a precedent for other emergency medical service organizations to follow. Today, Tebita Ambulance continues to work with policymakers to update and enhance emergency medical standards in Ethiopia (see GII 2024 Case study contribution from Rayner).

Regional variation

Social entrepreneurship is a global phenomenon. But there are significant regional differences regarding its prevalence, the issues addressed by social entrepreneurs and their organizational models (Mair, 2020). However, the absence of globally recognized definitions and comparable, high-quality data has left much of this variation unexplored. This lack of clarity has also hindered financial investment and the development of supportive policies at local, national and international levels (see GII 2024 Expert contribution from Bosma).

Evidence from the Global Entrepreneurship Monitor survey – one of the few global datasets asking questions about social entrepreneurship motivation and action, and a close data collaborator for the GII – finds substantial variation in prevalence by country (see GII 2024 Expert contribution from Bosma). The data indicate a strong presence of early-stage social entrepreneurs in Northern and Southern America, with Brazil and Guatemala showing some of the highest relative rates of social entrepreneurship among the countries surveyed (Figure 20).

Figure 20 Prevalence of social entrepreneurship among early-stage entrepreneurs, 2021–2022

Source: GII 2024 Expert contribution from Bosma based on data from the Global Entrepreneurship Monitor, 2021–2022.

One of the few attempts to compare the number of social enterprises across countries suggests that China has the highest absolute number, with 2,000,000 social enterprises, whereas the United States has the highest rate of social entrepreneurship, with approximately 38 social enterprises per 10,000 people (Schwab Foundation for Social Entrepreneurship and WEF, 2024). The United States has a healthy ecosystem for entrepreneurial activity in general (ranking among the top 3 most innovative nations in this year's and previous GII editions) and its relatively high percentage of socially-minded entrepreneurs contributes to this robust prevalence (see GII 2024 Expert contribution from Bosma).

However, data on social entrepreneurship are often biased toward a handful of countries, making balanced international comparisons impossible. For instance, less than half of all countries have any publicly available data on social entrepreneurship prevalence; and of those that do, most are either European, South and East Asian or Northern American countries (Schwab Foundation for Social Entrepreneurship and WEF, 2024; British Council and Social Enterprise UK, 2022).

Global comparisons of social entrepreneurship are further complicated by differing definitions. For instance, the UK Department for Digital, Culture, Media and Sport (DCMS) defines social enterprises as those organizations with an explicit social mission, with at least 50 percent of their income from trading activities, and which reinvest at least 50 percent of surplus/profit into their social mission (UK DCMS and BEIS, 2019). In contrast, the Republic of Korea's 2007 Social Enterprise Promotion Act defines social enterprises as having specific legal forms, paid employees, a primary focus on social objectives, a participative decision-making structure, and which direct two-thirds of profits toward social goals (OECD, 2022).

These small differences in definitions can lead to substantial variation in estimates of the number of social enterprises. In the United Kingdom, for example, there are an estimated 113,000 social enterprises as defined by the DCMS; but if the definition is narrowed to enterprises using a specific legal form, the number drops to 35,000; and if it is broadened to include all revenue-generating activities for social purposes, the number exceeds 380,000 (UK DCMS and BEIS, 2019).

Complicating the definition is the variety of legal forms that social enterprises can take, including for-profit, non-profit, as well as various hybrid forms that combine aspects of business and charity (Mair, 2020). Examples of such hybrid forms include the Benefit Corporation in the United States and the Community Interest Corporation (CIC) in the United Kingdom. But even in countries that have such hybrid forms, not all social enterprises use them. In the United Kingdom, for example, while some social enterprises are registered as CICs, many others are charities, sole proprietorships or limited liability companies (Social Enterprise UK, 2023). In Italy, the spectrum of legal forms is so broad that social enterprises are to be found across 15 different legal forms (Euclid Network, 2022). To complicate matters further, some social enterprises register multiple separate entities in order to manage the trade-offs between different legal forms.

Recently, there has been a push for jurisdictions to adopt dedicated legal forms for social enterprises, with the hope of increasing awareness, financial support and opportunities to participate in social procurement (see GII 2024 Expert contribution from Klijn and Bonnici).¹⁰ However, despite this effort, dedicated legal forms remain rare. In a survey of over 80 jurisdictions, only about 20 percent had dedicated legal forms for social enterprises, of which EU countries comprising a large proportion (Morrison & Foerster, LexMundi Pro Bono Foundation and Catalyst 2030, 2022). In most countries, social enterprises choose from among non-profit, for-profit, and co-operative forms.

Overall, the variation in definitions and legal forms has likely had a mixed effect. On the downside, it may have inhibited the growth of social entrepreneurship, as it is challenging for investors and policymakers to identify and support social ventures, thus limiting their potential to scale. On the upside, this same variation offers social entrepreneurs significant flexibility, enabling them to choose a legal form and organizational model that best supports their venture's mission. Therefore, while there is value in establishing uniform definitions and dedicated legal forms, such efforts should be undertaken carefully in order to avoid unduly constraining choice and flexibility for social entrepreneurs.

Financing

Financing is regularly cited as the most common issue faced by social entrepreneurs globally (Euclid Network, 2022; Social Enterprise UK, 2023). Among European social enterprises, for example, approximately 40 percent reported unmet financial needs (Euclid Network, 2022).

10 See also OECD, 2022.

While public financing is one of the most important sources of funds for social enterprises, it is unevenly distributed across regions. Moreover, impact investing – widely thought to be a promising and significant source of funding – makes up only a small proportion of the financing received by social enterprises.

Addressing such funding challenges will require a coordinated effort to expand public financing, with funds serving to de-risk early-stage ventures, thereby facilitating the expansion of impact investing and other sources of capital.

The most prevalent and sought after forms of financing globally are grants from philanthropic foundations and government agencies, as well as individual donors (Catalyst 2030 Annual Membership Survey 2023 data provided to the Authors; Centre for Asian Philanthropy and Society, 2019; Euclid Network, 2022). Such funds provide essential support for social enterprises, particularly in the early stages, allowing them to cover operational costs, develop innovative solutions and scale impact without having to worry about interest payments, principal repayment or equity dilution. Other sources include self-financing, private donations, bank loans and, to a lesser degree, impact investing (Table 11).

Table 11 Top 5 financing sources for social entrepreneurship

Source	Examples
Public financing	<ul style="list-style-type: none"> ·Public grants ·Public low-rate loans
Self-financing	<ul style="list-style-type: none"> ·Personal savings ·Funding from friends and family
Private philanthropy	<ul style="list-style-type: none"> ·Grants from award and fellowship organizations ·Concessionary/catalytic capital ·Accelerators/prize funding ·Donations and investments from high-net-worth individuals and families
Debt/loans (including microfinance)	<ul style="list-style-type: none"> ·Traditional bank loans ·Credit cards ·Microfinance
Impact investing	<ul style="list-style-type: none"> ·Socially responsible investing ·Green bonds ·Social bank loans ·Impact venture capital

Source: Authors' own representation based on data from European Social Entrepreneurship Monitor 2021–2022 (2022), drawing on Mair (2020); Centre for Asian Philanthropy and Society (2019); Siemens Stiftung (2020); British Council and Social Enterprise UK (2022).

Public financing in the form of government grants and low-interest loans are among the most prevalent forms of financing for social entrepreneurship. The availability of public financing for social entrepreneurship varies by region, typically correlating with the level of national wealth.

In the EU, approximately 40 percent of social enterprises receive public sector funding. This support is bolstered by various EU-wide social and environmental funds, such as the European Social Fund Plus (ESF+), Erasmus+, and Horizon Europe (Euclid Network, 2022).

In Asia, the public financing landscape is more diverse. In the Republic of Korea, for instance, public financing plays a crucial role, with around 60 percent of social enterprises benefiting from government grants annually, whereas in countries such as Indonesia, Thailand and Pakistan, social enterprises report public financing levels of 20 percent, 10 percent, and less than 10 percent, respectively (Centre for Asian Philanthropy and Society, 2019).

In the absence of formal financial services provided by either government, philanthropy or impact investment, social entrepreneurs turn to *self-financing*. Particularly in developing

countries, self-financing, often coupled with bootstrapping – the practice of getting by with minimum external investment – has become a go-to strategy (see GII 2024 Expert contribution from Afolabi on how social entrepreneurs in Nigeria resort to bootstrapping to navigate the funding landscape, because of there being few viable external financing opportunities).

In Algeria, Indonesia and Türkiye, for instance, more than 66 percent of social enterprises reported resorting to self-financing through family, friends and personal savings as a source of funding (British Council and Social Enterprise UK, 2022).

In the EU, self-financing is less common, with 40 percent of social enterprises reporting using savings and only 16 percent reporting having requested funding from family and friends (Euclid Network, 2022). The UK has one of the lowest rates of self-financing, with less than 10 percent requesting finance from family and friends, likely owing to the presence of a relatively robust governmental, philanthropic and impact investing ecosystem (Social Enterprise UK, 2023).

Private philanthropy was key to the emergence of social entrepreneurship in the early 2000s and continues to be a key source of capital with few conditions attached. Today, international philanthropic organizations and high-net-worth individuals and families give millions of dollars globally to social enterprises at all scales, often in the form of grants, but also through equity investment, loans and other financing tools.

Among European social enterprises, roughly 20 percent received funding from foundations between 2021 and 2022 (Euclid Network, 2022). While international philanthropic organizations have received much attention, domestic philanthropies are also a key source of financing, often in the form of grants. In Japan, more than half of all funding for social enterprises came from domestic foundation grants between 2018 and 2019 (Centre for Asian Philanthropy and Society, 2019).

Debt financing through *loans* is a less common form of financing for social enterprises, with the highest concentration in regions where public and philanthropic grants are less available. India and Sri Lanka have reported some of the highest rates of social enterprise debt financing at roughly 40 percent (British Council and Social Enterprise UK, 2022). In many parts of Africa, including Côte d'Ivoire, Egypt, Ethiopia and Rwanda, loans from commercial banks and microfinance organizations are a dominant financing source (Siemens Stiftung, 2020). However, loans in these countries often come with high and occasionally predatory interest rates, as well as significant collateral requirements (Siemens Stiftung, 2020). In response, new approaches to debt financing that offer concessionary interest rates have started to emerge, but these are not yet widespread (see, e.g., GII 2024 Case study contribution from Rayner on Grupo Mamut).

The *impact investing* market has grown substantially over recent years. Several estimates put the size of the global impact investing market in the low trillions of dollars (Hand, Ringel and Daniel, 2022; Volk, 2021). Yet impact investing still represents only a tiny fraction of the global pool of investable capital; and it is not a significant source of funding for most social enterprises. Notably, financing through impact investing is rare, even when access to advanced financial markets is available. Under 10 percent of social enterprises in regions with advanced capital markets request funding from incubators, business angels, impact investment, venture capital or venture debt (Social Enterprise UK, 2023; Euclid Network, 2022). One reason for such low rates of impact investing is that many social enterprises are too small to attract interest from investors – small ticket sizes create prohibitively high search and transaction costs for direct investment (Nicholls, 2021c).

Impact investing capital is also unevenly distributed globally, with funds concentrated in Europe and Northern America (Hand, Ringel and Daniel, 2022). Although current impact investors plan to step-up funding to social enterprises in developing economies, they are often not well connected to the ventures that are most in need of funding, creating a matching problem. Additionally, regional disparities in capital can inadvertently elevate certain issues over others. For example, the Global Impact Investing Network (GIIN) data suggest that today's impact investors tend to prioritize climate change mitigation and adaptation, while other issues like education and housing receive less attention in comparison (Hand, Ringel and Daniel, 2022).

Innovation and impact in social entrepreneurship

The global impact of social entrepreneurship is vast and varied, spanning issues such as access to education, sustainable clothing, peace promotion in conflict zones and the preservation of indigenous cultures. Across this wide range of issues, social enterprises share a common trait: they use innovation to create and scale impact, not just to drive financial performance (Seelos and Mair, 2017).

Innovation occurs first and foremost in the organizational models social enterprises adopt. And it is also evident in how they develop product and process improvements and use intellectual property (IP). Innovation in social entrepreneurship is often decentralized and deeply embedded within local contexts, with active participation from community members. Additionally, because many social enterprises operate in areas with limited public infrastructure and investment, they often assume roles that commercial innovators typically avoid, involving shifting the political, economic, social and cultural systems that perpetuate social and environmental problems.

Organizational model innovation

Social enterprises innovate within organizational models by embedding their social or environmental mission into one or more aspects of the business – namely, the customers they serve, the people they employ, the products or services they produce, or the broader ecosystems in which they operate (Table 12). Each of these approaches offers a distinct pathway to impact and is associated with distinct types of innovation activity.¹¹ While some social enterprises focus on a single pathway, many adopt multiple pathways, innovating across multiple dimensions of their organizational models.

11 Delivering impact from innovation activities requires that social enterprises translate these activities into outputs, outcomes and, ultimately, impact. See Nicholls, 2021a.

Table 12 Organizational pathways to impact in social entrepreneurship

Pathway	Source of impact	Core innovation activity	Examples
Customer	Customer or market segment served	<ul style="list-style-type: none"> • Process innovation • Consumer education • Marketing and branding 	<ul style="list-style-type: none"> • Target customers who lack access to essential products or services • Provide affordable solutions to underserved communities in low-resource contexts • Engage underserved communities in product and service development
Employee	Population employed	<ul style="list-style-type: none"> • Process innovation • Employee education and training 	<ul style="list-style-type: none"> • Hire from under-employed and marginalized populations • Provide skills development opportunities otherwise unavailable to employees • Provide flexibility and other benefits that suit under-employed populations • Prepare employees for sustainable, long-term employment opportunities
Product/service	Products or services sold	<ul style="list-style-type: none"> • Product/service innovation • IP • Open sourcing 	<ul style="list-style-type: none"> • Create products or services that surpass existing solutions in terms of social or environmental benefits • Design products or services that empower customers to have positive social or environmental impact • Develop socially or environmentally sustainable production processes
Ecosystem	Ecosystem surrounding the issue or problem area	<ul style="list-style-type: none"> • Systems innovation 	<ul style="list-style-type: none"> • Advocate for policy reforms • Support research • Build networks • Invest in awareness and education

Source: Authors' own representation, adapted from Besharov et al., 2019.

Social enterprises adopting the *customer pathway* achieve impact by providing essential products or services to specific populations or market segments that would otherwise have no or limited access (Box 4). The focus is often on reaching those populations that have been marginalized or stigmatized on the basis of income, race, gender or other characteristics, or have simply gone unnoticed by business and government. For example, microfinance organizations offer small loans and other financial products to the ultra-poor, often women, who could not otherwise access capital for starting a business.

The most important innovation activities associated with the customer pathway tend to involve process innovation, particularly to develop delivery systems to reach the target market, although there may also be innovation activities tailoring existing products or services so that they align with the particular needs of the target customer segment. Process innovation often involves education of consumers leading to an awareness of benefits that may, in turn, lead to changes in household or individual behavior. A core innovation within microfinance

organizations, for example, is to develop processes for reaching the ultra-poor, while a secondary innovation involves adapting loan products and other financial services to meet the needs of this same demographic (for example, through group lending).

Box 4 The customer pathway in action

Organization: Sustainable Organic Integrated Livelihoods (SOIL)

Geography: Haiti

Year founded: 2006

Revenues: Approximately EUR 2–3 million

Financing: Government and multilateral agencies (71 percent); donations (25 percent); earned income (4 percent)

Legal structure: Non-profit organization

Background: In Haiti, only 17 percent of the population has access to improved sanitation facilities – the lowest level in the Americas. To address this critical issue, SOIL was co-founded by Dr. Sasha Kramer and Sarah Brownell to provide a full-cycle sanitation service that treats human waste in order to limit the spread of disease.

Business model: SOIL targets Haitian households without access to centralized sanitation systems, offering low-cost container-based toilets and collection services. The collected waste is processed into organic compost and marketed under the *Konpòs Lakay* brand for agricultural use in farming and reforestation efforts.

Innovation activities:

Process research: SOIL has a dedicated research team focused on understanding sanitation issues in Haiti and improving services to meet customer needs.

Product/service adaptations: To better reach key populations, SOIL has developed portable household toilet models which do not require built infrastructure.

Innovation linkages:

Innovative financing tools: SOIL collaborates with the Haitian government, international development banks, and private funders to explore how blended finance can ensure the sustainability of public service provision through a combination of public and private financing.

Impact: SOIL's impact is evident in the more than 3,200 households and 19,000 individuals for whom they have provided toilets, collection services, and composting waste treatment which has helped limit disease, improve living standards and personal dignity, and expand healthy forests.

Source: Authors' own representation based on the GII 2024 Case study contribution from Rayner.

Social enterprises adopting the *employee pathway* (also known as work integration social enterprises) (Box 5) generate impact by hiring under-employed or marginalized populations to work in the organization and supporting them with the training and skills development that will enable them to remain within employment (Joyce *et al.*, 2022). Often, such individuals face challenges in finding jobs due to societal biases and stigma, limited skills and education, or disabilities. In addition to providing a direct source of income and offering meaningful work to individuals from these populations, social enterprises engaging the employee model often invest significantly in enhancing their employees' skills and supporting them in securing new job

opportunities that offer higher wages, thereby helping to break the cycles of poverty and bias (see, e.g., Smith and Besharov, 2019).

The most important innovation activities within the employee pathway often involve process innovations. Examples are redesigning hiring processes so as to identify candidates with potential for upskilling and restructuring workflows so that they align with the abilities rather than the limitations of the target employee population. Employee education and training are also crucial innovation activities. Social enterprises adopting the employee pathway frequently invest heavily in their human capital so as to overcome challenges related to poverty, stigma or disability, thereby fostering future innovation potential.

Box 5 The employee pathway in action

Organization: iKure

Geography: India

Year founded: 2010

Revenues: Approximately EUR 2 million

Financing: Earned income (95 percent); grants and other sources (5 percent)

Legal structure: For-profit company

Background: Access to primary health care services in rural India often requires patients travel long distances at significant cost. Sujay Santra, an IBM and Oracle IT engineer from West Bengal, founded iKure to bring quality primary services to rural communities via a hub-and-spoke model after watching his father go through the challenges of rural health care.

Business model: The iKure model is based around 10 health care hubs and 160 peripheral clinics serving rural patients. Central to the model are the community health workers that iKure selects, contracts and trains from within the communities in which it works. These health workers visit homes, collect and capture diagnostic data, and return to peripheral clinics to access services for patients.

Innovation activities:

Employee training: iKure invests heavily in training its community health workers, who often have minimal prior expertise and may lack those basic skills, such as using a smart phone, that are often essential for securing employment.

Process adaptations: Given that many of iKure's community health care workers operate within rural settings where internet connectivity is either low or non-existent, iKure has invested in and developed a remote data collection system using point-of-care devices powered by GPS.

Innovation linkages:

New technology training: To efficiently and accurately capture health data, iKure trains their community health workers in using the latest available portable diagnostic tools.

Impact: iKure's impact can be seen in the more than 120 woman community members contracted to provide health services in "last-mile" communities. In addition, iKure operates 10 health care hubs and 160 peripheral clinics, providing treatment to more than 3 million individuals across over 6,400 villages.

Source: Authors' own representation based on the GII 2024 Case study contribution from Rayner.

Social enterprises adopting the *product/service pathway* generate impact by developing and selling socially- and environmentally-friendly products or services (Box 6). In some cases, these offerings address significant social or environmental challenges directly, as is the case with social enterprises that provide critical health services such as primary eye care or diarrheal medication. In other cases, the product/service pathway entails offering more socially or environmentally sustainable versions of existing products or services that have negative externalities, as is the case with social enterprises that sell products made from recycled or renewable materials. And in some cases, the offering may be a mix of both, for example, illustrated by Eco Femme, an Indian producer of reusable, low-cost menstruation pads.

The most important innovation activities associated with the product/service pathway tend to involve product innovation, including research and development (R&D) and engineering innovations to design more sustainable or socially beneficial products or services. Product/service innovations often require significant “action research,” in which social entrepreneurs engage deeply with community members so as to understand their needs and desires. These organizations may also pursue IP to protect and legitimize their investments, although many social entrepreneurs find the patent process to be costly, time-intensive and, ultimately, difficult to enforce within the contexts in which they operate. Additionally, some social entrepreneurs use open-sourcing of their product/service innovations as a means of generating further impact, rather than focusing on IP protection in order to capture market share, as is common in much commercial innovation.

Box 6 The product/service pathway in action

Organization: Eco Femme

Geography: India, with international sales

Year founded: 2010

Revenues: Approximately EUR 250,000

Financing: Earned income (75 percent); grants (25 percent)

Legal structure: Unique legal entity that allows for commercial and non-commercial activities

Background: More than one-quarter of the world’s population is of reproductive age. Yet many do not have access to products or education on maintaining healthy, dignified menstruation. Such a circumstance is especially acute in areas where basic sanitation infrastructure is lacking, or menstruation is stigmatized. Further, traditional menstrual products are not sustainable, often using a substantial amount of nonrecyclable materials. To address these issues, Eco Femme was co-founded by Kathy Walkling, Jessamijn Miedema, Anita Budhreja and Anbu Sironmani.

Business model: Combining commercial and non-commercial operations, Eco Femme sells low-cost, reusable, and organic cloth menstrual pads both locally and internationally and uses the revenues to provide menstrual health education and free or subsidized cloth pad distribution. A sliding-scale pricing model is deployed to cater to different populations and ability to pay.

Innovation activities:

Product design innovation: Eco Femme continuously improves its product design to better meet customer needs and environmental goals. They switched to organic cotton, for example, after reaching a sales threshold that allowed them to source in bulk.

Pricing innovation: Recognizing differing income levels among customers, Eco Femme developed a sliding-scale pricing model where wealthier customers help subsidize pads for poorer women.

Innovation linkages:

External research consultants: Eco Femme collaborated with a research consultant to develop a comprehensive monitoring and evaluation module for its menstrual health education.

Training non-profits: Eco Femme extends its impact and reach by training and working with a large network of approximately 60 NGOs and individuals in menstrual health education and distribution of its cloth pads throughout India.

Impact: Since 2010, Eco Femme has distributed nearly 1.4 million pads, impacting nearly 90,000 girls and preventing approximately 104 million disposable pads from reaching landfills.

Source: Authors' own representation based on the GII 2024 Case study contribution from Rayner.

Social enterprises adopting the *ecosystem pathway* create impact by mobilizing diverse groups of social actors to effect transformation within local, regional or even global ecosystems (Box 7). Outside actors engaged within these models encompass a wide range of stakeholders, including fellow social entrepreneurs seeking collaboration on products and services, underserved populations, policymakers, academics, journalists and others. By advocating for policy changes, engaging communities, supporting research, fostering networks and investing in awareness and education, the ecosystem pathway can generate varied and lasting impacts at a significant geographical scale.

In the ecosystem pathway, engaging in systems innovation is the core activity. This can take several different forms, including shifting policy, engaging communities, supporting research, building networks, and undertaking awareness and education initiatives to achieve social or environmental change. Across all these forms, systems innovation involves engaging with stakeholders in a collaborative rather than competitive manner. In markets where policies and standards are unreliable, public infrastructure limited and consumers unserved, the focus is on creating a viable sector with a healthy number of actors, rather than protecting market share.

Box 7 The ecosystem pathway in action

Organization: WeRobotics

Geography: Global

Year founded: 2015

Revenues: Approximately EUR 2-3 million

Financing: Donations (25-60 percent), earned income (10-40 percent), in-kind donations of technology and services (30-35 percent)

Legal structure: Non-profit organization

Background: Drones, when combined with data and AI technologies, can significantly enhance decision-making regarding a wide variety of issues, including climate action, disaster management and agriculture. Local experts are often best placed to deploy these technologies. Yet they are often disconnected from international partners and tech firms. WeRobotics began as a collaboration between Sonja Betschart and Adam Klaptocz of Drone Adventures and Patrick Meier and Andrew Schroeder of UAViator. The co-founders established a network of Flying Labs in over 40 countries so as to integrate local expertise with drone, data and AI technologies, and thereby enhance international development initiatives.

Business model: WeRobotics provides a platform for local drone, data and AI experts to connect with global and local organizations and industries, deploying and improving drone and associated technologies in this highly regulated and expertise-intensive sector. The WeRobotics

network connects local “Flying Labs” (independent organizations with technological expertise) in over 40 countries across Africa, Latin America, and the Asia Pacific regions.

Innovation activities:

Network-building: WeRobotics’ activities focus on validating local expertise and facilitating a network that is fully driven by local agency, accountability and self-sustainability, with sharing and collaboration as its core values. Additionally, the network provides opportunities for experts to expand their knowledge and connect with potential collaborators to develop new technologies.

Awareness and education work: Local technology experts in developing regions often struggle to gain legitimacy with large international technology firms and policymakers. WeRobotics works to shift such a mindset by demonstrating the value of incorporating local expertise.

Process improvements: WeRobotics developed an annual application process to license local experts to join the Flying Labs network, ensuring a network with high standards and reliability.

Innovation linkages:

Open sourcing organizational structure: WeRobotics spends significant time and energy documenting, improving and sharing its model and structure so that other organizations can copy their locally-led approach.

Connecting to existing drone and AI innovators: By providing pro bono drone and AI technology to local experts and companies, WeRobotics enables them to learn and deploy these technologies for local projects.

Impact: WeRobotics has developed 41 Flying Labs with 56 partners and 266 local and international supporters, and it has made 498 opportunities available through its network since 2019.

Source: Authors’ own representation based on the GII 2024 Case study contribution from Rayner.

Product and process innovation

Social enterprises are actively engaged in product and process innovation. A survey of European social enterprises, for instance, found that 60 percent planned to scale in the near future by introducing new products or services; 30 percent by implementing new processes; and 20 percent by investing in either new equipment, information technology (IT) or computer software (Euclid Network, 2022). Globally, similar trends can be observed. More than 50 percent of social enterprises in Morocco, Nigeria, the Philippines, Thailand and Viet Nam also plan to scale through the development of new products and services (see British Council, 2018a, 2018b, 2019, 2020, 2022; British Council and Social Enterprise UK, 2022).

We see a similar emphasis on product and process innovation among social enterprises reported in the GII 2024 Case study contribution from Rayner. Grupo Mamut, for example, a Bolivian manufacturer of rubber products recycled from tires, has recently reinvested roughly USD 500,000 into the creation of a sustainable materials laboratory to research and develop new products. In an example of process innovation, Community Design Agency in India has continuously refined its participatory design processes so they better meet the needs of low-income housing residents.

Beneath the surface, there are nuances in how social enterprises pursue innovations. In particular, social entrepreneurs often engage local communities in the innovation process, with R&D frequently involving those people most affected by the issues that social enterprises seek to address, rather than occurring in labs, innovation centers or meeting rooms far way (see GII 2024 Expert contributions from Montoya Castaño on Participatory Action Research

at Universidad Nacional de Colombia; Kraemer-Mbula on R&D practices among African social enterprises).

This proximity to the problem is what allows social enterprises to create innovative products and processes. An example is Fairtrasa International AG, a global social enterprise that distributes produce from organic smallholder farmer cooperatives in Latin America, Africa and Asia to retailers and wholesalers across Europe. After years of working with smallholder farmers, Fairtrasa realized that these farmers often lacked the resources or expertise to engage with the latest technology or local best practices for organic, regenerative farming. This led them to develop a three-tiered model to train and organize smallholder farmers globally (see GII 2024 Case study contribution from Rayner).

A second difference involves social enterprises' commitment to the use of innovation for positive social impact. This approach introduces added costs, complexities and ethical responsibilities to the innovation process. For instance, before launching Greenhope, an Indonesian producer of biodegradable resins, co-founder Sugianto Tandio spent 10 years developing and patenting a fully biodegradable resin made from cassava starch (see GII 2024 Case study contribution from Rayner). Despite having the option of stopping at a partial solution, Tandio persisted in creating a product that was 100 percent biodegradable, driven by a commitment to ensure that the product would do no harm.

Even seemingly simple innovation activities, like diffusing a technology from one place to another, can come at a significant cost, when social enterprises engage in meticulous cultural sensitivity research so as to ensure that products or processes they develop will have the desired positive social impact. For example, Smart Start, an early childhood development training and licensing service operating in South Africa, changed from a cost-effective playgroup model educating kids two days a week to a more frequent programme, after research revealed that many families lacked access to child care during off days (see GII 2024 Case study contribution from Rayner).

The work underlying this report also found some significant spillover effects of innovation in social enterprises. Specifically, the introduction of new products and practices in social enterprises has often been found to stimulate private sector innovation in more formal corporations or governmental institutions (see GII 2024 Background study from Hottenrott).

Social entrepreneurship and intellectual property

The use of IP among social enterprises varies widely. Some organizations invest heavily in traditional IP to secure patents and trademarks, others adopt open-source or other non-restrictive models, and many fall somewhere in between (see GII 2024 Expert contribution from Kraemer-Mbula).

Traditional IP activity is often concentrated in social enterprises operating in sectors that require heavy investment in R&D, such as technology and medicine (see GII 2024 Expert contribution from Kraemer-Mbula). Patents and trademark rights not only enable social enterprises to develop long-term revenue from innovation investments, but also serve as powerful signals of legitimacy for organizational models that may be regularly contested by investors, suppliers and partners. For instance, Greenhope has invested significant resources in securing six patents across the United States, Singapore and Indonesia. However, patenting can be costly and may not be the most reliable vector of protection in regions where IP rights are weaker. Bandhu, for example, considered applying for a patent, but ultimately decided against it, because of the expense and complexity involved (see GII 2024 Case study contribution from Rayner).

Trademarks, in turn, offer social enterprises the opportunity to legitimize their brand and protect their investment in brand equity, such as in community outreach and customer and supplier education. Trademarks to protect their main brand name are fairly common among social enterprises worldwide. In a sample of over 300 social enterprises from the Skoll

Foundation and Schwab Foundation awardee communities, 37 percent had active trademarks, with a median of two trademarks per venture.¹²

Many social enterprises, however, do not engage in filing for formal IP protection. Since the primary goal of social entrepreneurship is not necessarily profit but social impact, these organizations often do not resort to formal IP but use different means to diffuse product and process innovations so as to help scale benefits. Open-sourcing software and other technologies for the benefit of other social enterprises, governments and even corporations is a common scaling tactic (see GII 2024 Case study contribution from Rayner on Bandhu, Community Development Agency, WeRobotics). But the potential role of formal IP is often underappreciated or unknown. Even with a strong emphasis on collaboration, social enterprises may benefit from learning more about and utilizing IP, and correspondingly from greater policy support to develop this capability – a point returned to in the concluding section of this chapter which is on policy implications.

Systems innovation

Innovation activities do not stop at the factory gates or office door. Beyond product and process innovation and IP activity, social enterprises also engage in systems innovation. This involves novel approaches to shaping the political, economic, social and cultural systems that perpetuate the social problems that social enterprises seek to address (see GII 2024 Expert contribution from Billimoria).

These activities are particularly common in social enterprises emphasizing the ecosystem pathway to impact. This is because they allow social enterprises to shift cultural biases regarding marginalized or stigmatized populations and issues, modernize sector practices and norms, and help alter laws and policies, thereby developing or altering the ecosystem around a focal problem area (Table 13).

Yet systems innovation is not limited to organizations adopting the ecosystem pathway. Eco Femme, for instance, which primarily pursues the product/service pathway, works to destigmatize education about menstruation and menstrual products in India. Fairtrasa, which primarily pursues the customer pathway, has been working to deploy new technology solutions that enable smallholder farmers in developing countries to link directly with consumer-packaged goods firms. And Smart Start, which also focuses on the customer pathway, co-developed first-of-its-kind policies and standards on early childhood development at the national and provincial levels in South Africa (see GII 2024 Case study contribution from Rayner).

Data from Ashoka, whose work supports one of the longest-standing global networks of social entrepreneurs, suggests that these are not just isolated examples: 66 percent of over 800 social entrepreneurs in Ashoka's network have advised policymakers or legislative bodies; 63 percent have achieved legislative change or influenced policy; 62 percent have provided research and or data to policymakers; and 57 percent have convinced government to allocate funds to specific causes (Valera *et al.*, 2022).

12 Authors' data on Skoll Foundation and Schwab Foundation Social Entrepreneur awardees; $n=323$.

Table 13 Forms of systems innovation in social entrepreneurship

Form of systems innovation	Description	Examples
Policy shifts	Influencing or changing policies to better support social and environmental goals	<ul style="list-style-type: none"> · Co-creating policies and standards with peers and governments · Seconding staff to government agencies to develop policies and write industry standards · Promoting new entity types and taxation policies for social enterprises
Research support	Participating in or funding research to advance understanding and solutions for social issues	<ul style="list-style-type: none"> · Sponsoring studies · Providing data to local governments · Partnering with universities to better understand key problems
Network-building	Establishing and nurturing networks among stakeholders to foster collaboration and resource-sharing	<ul style="list-style-type: none"> · Creating advocacy coalitions of NGOs · Connecting government agencies to relevant local actors · Connecting local suppliers with international markets · Building alliances between businesses and social enterprises
Awareness and education initiatives	Raising awareness and educating the public or specific groups about social or environmental issues	<ul style="list-style-type: none"> · Launching small business education initiatives focused on impactful procurement · Organizing workshops on sustainable practices

Policy opportunities to unlock the promise of social entrepreneurship

Social entrepreneurship has had a significant impact in tackling complex social and environmental problems. Yet, there are still formidable barriers to overcome in unlocking its full transformative potential. Policy has a critical role to play in removing these barriers and enabling further innovation and impact in social entrepreneurship.

Globally, governments and international bodies have started to develop solutions for some of the innovation challenges social entrepreneurs face (see GII 2024 Expert contribution from Klijn and Bonnici). For example, the OECD has recently produced in-depth manuals for policymakers on developing legal frameworks for social enterprises, measuring social impact, conducting impactful public procurement, and providing training social entrepreneurs. Moreover, many jurisdictions are pushing ahead with advanced policy support. A review of 75 jurisdictions globally found that 20 percent have dedicated legal forms for social entrepreneurship; 30 percent offer government funding support; and 20 percent offer operational support such as training or consulting.¹³

Yet, unlocking the full innovation and impact potential of social entrepreneurship will require more comprehensive action. Drawing on the expert contributions to the GII 2024 Special theme (available online), we highlight the barriers to and opportunities for social entrepreneurship

13 Authors' analysis of LexMundi Pro Bono Foundation Social Enterprise Law Surveys Database. Available at: <https://www.lexmundi.com/guides/social-enterprise-law-surveys>.

across six dimensions: namely, institutional frameworks, human capital, infrastructure, networks, financing, and measurement (Table 14).¹⁴

Table 14 Barriers and opportunities in social entrepreneurship

Dimension	Barriers	Opportunities
Institutional frameworks	<ul style="list-style-type: none"> · Constraining legal forms · Lack of dedicated support services · Limited collaboration between policymakers and social entrepreneurs · Regulatory restrictions 	<ul style="list-style-type: none"> · Specialized legal forms · Dedicated agencies and support services for social enterprises · Spaces for collaboration between policymakers and social entrepreneurs
Human capital	<ul style="list-style-type: none"> · Complex skillsets required of social entrepreneurs and their employees · Limited knowledge of traditional innovation ecosystem 	<ul style="list-style-type: none"> · Higher education curricula on social entrepreneurship · Social entrepreneurship training programmes · Innovation education programmes
Infrastructure	<ul style="list-style-type: none"> · Lack of global data collection, standards and definitions for social entrepreneurship · Regional disparities in infrastructure 	<ul style="list-style-type: none"> · Internationally agreed standards and definitions · National data registries · Programmes to help social entrepreneurs reach geographies with limited infrastructure
Networks	<ul style="list-style-type: none"> · Gaps in global awareness and knowledge · Complexities in public/private research systems · Weak connections between research systems in advanced economies and developing regions 	<ul style="list-style-type: none"> · Public backing of social entrepreneurship networks · Public–private–social sector research partnerships · University partnerships across advanced economies and developing regions
Financing	<ul style="list-style-type: none"> · Investor knowledge gaps · Insufficient financing for small and mid-sized social enterprises · High self-financing rates · Low and uneven rates of impact investing 	<ul style="list-style-type: none"> · Investor awareness campaigns · Procurement incentives to support social enterprises · Investor incentives · Tax incentives for legal forms that enable pursuit of social benefits · Tailored public financing for small and mid-sized social enterprises
Measurement	<ul style="list-style-type: none"> · Disagreement about how to best measure impact · Difficulty translating impact into quantitative metrics · Lack of accepted certification processes · Low impact measurement rates among social enterprises 	<ul style="list-style-type: none"> · Investment in impact accounting research · Public or government-supported third-party certification systems · Public support to train and finance social enterprises in impact measurement capabilities

Source: Authors' own representation based on GII 2024 Expert contributions.

14 The dimensions of policy barriers and opportunities correspond to the GII's input and output pillars.

Institutional frameworks

Develop supportive legal and regulatory environments

Globally, the institutional frameworks supporting social entrepreneurship innovation – encompassing regulatory quality, rule of law and agency support – remain underdeveloped. Many countries lack a specific legal form for social entrepreneurship and impose restrictions that limit scaling opportunities. For instance, regulations often prevent directors of traditional for-profit ventures from considering social or public benefits alongside shareholder returns (Morrison & Foerster, LexMundi Pro Bono Foundation and Catalyst 2030, 2022). Such gaps expose social enterprises to legal risks and bureaucratic hurdles. And they restrict access to funding and partnerships, which in turn inhibits organizational growth (see GII 2024 Expert contribution from Afolabi).

Governments have an opportunity to develop facilitative institutional frameworks and regulatory policies that help social enterprises to flourish. Establishing legal definitions for social entrepreneurship is a crucial first step. These definitions should align with international peers and or transnational organizations so as to enable global collaboration, research and funding.¹⁵ Additionally, policymakers should adopt specific legal forms that facilitate the joint pursuit of social and financial goals, such as the Benefit Corporation in the United States and the Community Interest Corporation in the United Kingdom.

Creating dedicated governmental units or departments to support social entrepreneurship is also essential. In a sample of 75 jurisdictions, less than 10 percent had such specialized support.¹⁶ These structures can help legitimize local social entrepreneurial efforts; support nascent social ventures; facilitate collaboration between social entrepreneurs and policymakers; and advocate for the removal of legal and policy restrictions (see GII 2024 Expert contribution from Bilimoria on the importance of formalized government support).

There is also a need for policymakers to collaborate with social entrepreneurs to remove restrictions associated with non-specialized legal forms. Existing regulations designed for traditional non-profit or for-profit organizations often hinder impact and innovation in social enterprises. For example, restrictions on foreign philanthropic investment into non-profits limits access to essential international funding sources for social enterprises (Oelberger and Shachter, 2021).

Human capital

Invest in education and training programmes

Social enterprises face substantial hurdles in accessing quality human capital, with many social entrepreneurs reporting challenges in finding employees with the right skillsets (Social Enterprise UK, 2023; Euclid Network 2022). To drive forward more innovation, social enterprises need a workforce that has technical skills in areas such as finance, accounting and engineering alongside relational and cultural skills in areas such as communication and community engagement, and local language fluency, as well as historical and contextual knowledge (Battilana and Dorado, 2010). This unique mix of skills has not been emphasized globally and is further complicated in developing countries by substantial rates of out-migration (see GII 2024 Expert contribution from Afolabi).

Similarly to small and medium-sized enterprises (SMEs), social enterprises may also lack skilled human capital that has the capacity to tap global knowledge and information resources, such as the knowledge incorporated in scientific publications or patent documents, in order to find possible solutions to technical or process challenges.

¹⁵ See OECD guidance on designing legal frameworks for social enterprises; OECD, 2022.

¹⁶ Authors' analysis of LexMundi Pro Bono Foundation Social Enterprise Law Surveys Database. Available at: <https://www.lexmundi.com/guides/social-enterprise-law-surveys>.

Policymakers have an important role to play in ensuring social enterprises have access to the human capital needed for innovation. Growing a supply of capable entrepreneurs with relational and cultural skillsets begins with changes to school curricula so as to emphasize entrepreneurialism with a social impact (see GII 2024 Expert contribution from Çiftçi on King's College Nepal's social entrepreneurship courses). Publicly-supported training programmes can also have a major impact on the prevalence and robustness of social entrepreneurship. For instance, social enterprises that completed the United Kingdom's School for Social Entrepreneurs programme reported an average 40 percent increase in earned income and had a two-year survival rate of 81 percent, compared to 73 percent for UK SMEs (AKOU, 2023).

Infrastructure

Promote data collection

The lack of data on social entrepreneurship is a major infrastructure deficiency holding back innovation and impact. As two recent efforts to quantify the number of social enterprises globally reveal, large parts of the world have no data on social entrepreneurship, and in those places that do have data the samples are small, out of date or based on competing definitions (Schwab Foundation for Social Entrepreneurship and WEF, 2024; British Council and Social Enterprise UK, 2022). Without access to comparable and high-quality data, policymakers will struggle to regulate and allocate resources appropriately; impact investors will continue to overlook the role of social entrepreneurship in building economies and changing lives; and social entrepreneurs will miss out on valuable opportunities to catalyze impact.

In addition to developing globally recognized legal definitions, governments must align on data standards and functional definitions for social entrepreneurship. National data registries or regular surveys that gather information on prevalence, legal forms, organizational models, turnover and impact can provide critical inputs for building an ecosystem capable of addressing innovation challenges and scaling social entrepreneurship.

Assist social entrepreneurs in reaching underserved communities

Regional disparities in innovation infrastructure, including access to information and communication technologies, stable and affordable energy, and government services, are particularly critical for social entrepreneurship, which often targets communities with the least access. Infrastructure gaps are increasingly extreme in both developed as well as developing countries, creating challenges for social entrepreneurs everywhere as they seek to meet the needs of disadvantaged communities. In India, for example, the divide between urban and rural areas in terms of access to health care, financial literacy and gender equity makes it difficult for social enterprises to reach the most vulnerable populations (see GII 2024 Expert contribution from Kannan and Ramanujam on the social enterprises working in India to overcome these barriers; GII 2024 Case study contribution from Rayner on iKure).

National and local governments have a role to play in helping to bridge regional disparities by providing increased support to social entrepreneurs operating within disadvantaged communities. This support could include grants, subsidies, tax benefits and investment in critical infrastructure projects tailored to the unique needs of such regions, thereby enabling social entrepreneurs to operate more effectively and sustainably.

Networks

Incubate social enterprise networks

Unlike large corporations and philanthropic organizations, social enterprises often struggle to gain attention, because of their small size and hybrid nature. Moreover, because they blend aspects of multiple forms of organizing, social enterprises do not fit neatly into existing categories. Without visibility and credibility, social enterprises often miss out on impactful partnerships and a deeper engagement with existing support structures for innovation. These issues are particularly acute for social enterprises working with advanced technologies such as AI, data analytics, smart logistics and fintech, where strategic partnerships are becoming

essential for accessing expertise and modern technology (see GII 2024 Expert contribution from Kraemer-Mbula; GII 2024 Case study contribution from Rayner on WeRobotics).

Governments can play a crucial role in addressing these challenges by helping to incubate social enterprise networks and alliances. Organizations such as the Euclid Network in Europe and Catalyst 2030, which represents social entrepreneurs globally, leverage collective strength in order to capture media, government and business attention, and connect social enterprises to valuable public and private partnerships (see GII 2024 Expert contribution from Bilimoria). Policymakers can help to legitimize and grow these organizations by engaging them in meaningful discussion, providing funding and facilitating access to new partners – particularly those with capabilities in advanced technologies who can help to upskill social enterprises.

Deepen research links between advanced and developing economies

Uneven development of the research and education ecosystem, including accelerators, universities and public research partnerships, further impedes innovation within social enterprises. Concentrated in a few hyper-productive regions, existing innovation ecosystems are ill-equipped to support the local needs of social entrepreneurs, especially in developing regions.

The presence of well-resourced local research universities can substantially benefit social enterprises by helping to identify pressing local issues, legitimize fledging social ventures and diffuse their innovative products, processes and services (see GII 2024 Expert contribution from Montoya Castaño).

At the same time, social entrepreneurs could also better leverage the potential of existing know-how, research, and research institutions and universities. Links between social entrepreneurs and key actors in existing innovation ecosystems are often weak. Social entrepreneurs may not routinely seek solutions within an existing body of knowledge or reach out to universities and public research institutions to collaboratively conduct or commission R&D geared to solving their technological or process challenges. Alongside stronger ties between social entrepreneurs and existing innovation ecosystem actors, there is a need to increase the absorptive capacity of social enterprises. This often due to them not having R&D departments or trained personnel who can digest and apply existing public research results, as well as proactively request new, targeted research for the enterprise's venture.

Financing

Raising investor awareness

Social enterprises face challenges in gaining the attention of funders, both public and private, because funders often understand neither social enterprises' needs nor their impact potential, and, moreover, they struggle to verify and compare social impact across ventures. For example, 40 percent of social enterprises report that they have experienced a lack of awareness and understanding among banks, investors and support organizations (Euclid Network, 2022).

To address these gaps, it is crucial to educate private investors, financial institutions and policymakers about the pathways through which social enterprises generate impact. Governments can draw inspiration from award-giving organizations such as the Skoll Foundation and the Schwab Foundation for Social Entrepreneurship, which have positively influenced the trajectory of social entrepreneurship and raised its visibility. Publicly-supported awards and grants can help highlight and finance exceptional social enterprises, while also educating private investors about the positive social impact of these ventures.

Expanding public financing

The availability of financing for social entrepreneurship remains a significant constraint, leading to high rates of self-financing, high-interest debt and overall slow growth. While some governments have made investments into social enterprises, more action is needed to create a supportive financing environment. Tax and procurement incentives, as well as tailored grant funding, are critical levers.

Tax incentives for dedicated legal forms that facilitate the joint pursuit of social and financial objectives can encourage the establishment of new social enterprises and provide additional resources for reinvestment in impact and innovation. Procurement incentives, such as those established by the United Kingdom's Social Value Act (see GII 2024 Expert contribution from Klijn and Bonnici), can help local and national governments to create supply strategies that emphasize public benefits, while enabling social enterprises to grow their trading activities.

Tailored grant funding – which involves promoting funding opportunities; offering size-dependent funding, simplifying application processes; and providing guidance on minimally intrusive impact measurement requirements – can address gaps in mid-range financing and the substantial search and transaction costs associated with applying for grants. These issues are particular challenges for small and mid-sized social enterprises. Tailored grant funding has significant potential to help such organizations to grow and become more attractive to impact investors.

Creating incentives for private investment

Impact investing has predominantly focused on relatively large, low-risk organizations, leaving most social enterprises with a limited access to the transition funding required for scaling beyond proof-of-concept (see GII 2024 Expert contribution from Dey and Gupta). To mitigate this issue, governments can play a role in reducing the perceived risk associated with investing in social enterprises.

This can be achieved through blended financing mechanisms, concessionary capital and the establishment of funds dedicated to social enterprises, making them more attractive to large institutional investors. Public and philanthropic funders can provide concessional investments so as to lower risk and attract larger sums of private impact capital. Additionally, public support can help to create more robust financing ecosystems through social entrepreneurship funds and funds-of-funds, which facilitate connections between public-private capital and groups of social enterprises. This approach allows investors to customize investments so they align with their capital goals, thereby enhancing the overall growth and impact of social enterprises.¹⁷

Measurement

Investment in public-private certification and measurement approaches

The comprehensive and accurate measurement of social impact remains a challenge for all impact-oriented organizations (see GII 2024 Background study from Hottenrott and Expert contribution from Garg Patel).¹⁸ Over the last 15 to 20 years, coordinated efforts by investors, governments, researchers and impact practitioners have advanced the development of various tools and frameworks for the purpose of systematically quantifying impact. These include metrics taxonomies like the Impact Reporting and Investment Standards (IRIS and IRIS+) and rating services such as the Global Impact Investing Rating System (GIIRS), as well as the 60 Decibels benchmarks (see GII 2024 Expert contribution from Kraemer-Mbula). While these efforts represent immense progress, measuring the impact of social entrepreneurship remains challenging due to limited data, human capital and financial resources, and the localized nature of many of the issues social enterprises address.

Existing efforts to quantify the impact of social entrepreneurship tend to take three main forms.

Person-based measures focus on the total number of lives affected. For example, the 3,200 social enterprises in the Catalyst 2030 network have touched over one billion lives, and the Schwab Foundation's 470 social entrepreneurship awardees have reached over 891 million lives over the past 25 years.¹⁹

17 For additional detail on policies to support sustainable financing of social entrepreneurship, see Nicholls, 2021b.

18 See also Zulkefely *et al.*, 2022.

19 See Catalyst 2030 (available at: <https://catalyst2030.net/>) impact measurement; Schwab Foundation for Social Entrepreneurs impact measurement, 2024.

Resource-based measures focus on the amount of money raised or earned by social enterprises, the vast majority of which is invested or reinvested back into their respective social or environmental missions (Euclid Network, 2022). For example, the 3,200 social enterprises in Catalyst 2030's network have raised over USD 2.2 billion in funding, and the 64 social enterprises in the three most recent cohorts of Schwab Foundation awardees have total revenues of over USD 900 million.

And finally, *issue-based* measures focus on metrics tailored to the specific social or environmental challenge being addressed. Assessing the impact of social enterprises working on health, for example, would involve tracking the number of patients screened or receiving medicine, or the number of health products provided; while assessing the impact of social enterprises that tackle inequality might involve tracking metrics, such as the gender pay gap or the political representation of marginalized groups.

Such variation in approaches to measuring impact is a double-edged sword. On the one hand, it makes it difficult for policymakers to assess the overall impact of social entrepreneurship and for investors to make comparisons across different ventures, when deciding where to allocate capital. Among impact investors, for example, the challenge of impact comparison is the single most significant issue today (Hand, Sunderjit and Pardo, 2023). On the other hand, varied approaches to measuring impact help to capture important underlying differences in how social enterprises create impact, which would otherwise be lost if the field converged on a single, standardized metric.

Consider, for example, how impact measurement differs along the customer, employee, product/service, and ecosystem pathways:

- Assessing impact from the *customer pathway* often involves measuring the number of customers reached. Yet it is important to go beyond simple counts of customers and consider what further downstream changes (both positive and negative) occur when new customer segments have access to previously unavailable products or services. Microfinance loans, for example, can impact recipients' economic security and their socio-emotional well-being, as well as that of their families and communities.
- The impact of the *employee pathway* is often assessed by measuring the number of employees hired, the wages paid and the investment in employee training. Yet, as with the customer pathway, it is important to consider downstream impacts as well; for example, the increase in overall lifetime earnings and improvements in self-confidence, self-efficacy and other measures of well-being.
- The impact of the *product/service pathway* is often assessed based on the volume of products and services sold. However, it is also important to consider the longer-term positive and negative consequences of these products. For organizations selling products or services made from recyclable or renewable materials, a crucial measure of impact would be the amount of waste, emissions or pollution saved by customers adopting these products or services instead of conventional alternatives.
- Assessing the impact of the *ecosystem pathway* is particularly challenging. This goes beyond direct measures, such as the number of actors involved or mobilized within an ecosystem. The downstream impact created through the ecosystem pathway can also be measured through tracking changes in legislation and the levels of new knowledge creation, as well as shifts in social norms and attitudes. Overall, this pathway may be both the most important source of impact and the one that is most difficult to measure.

We are still years away from any globally accepted measurement standards for gauging impact. However, policymakers can take immediate action to help improve metrics. National and international support for accounting research on social impact can expedite the development of standardized measures that ensure critical considerations, such as the diversity of social entrepreneurial issues, impact pathways and innovation strategies, are properly accounted for. Additionally, public or state-recognized third-party certification systems can help social enterprises connect with both public resources and impact investors. A key component of any certification process should be supporting social enterprises in developing their impact reporting capacity and ensuring that the certification process is as straightforward as possible. Globally, many social enterprises lack the resources or expertise required in order to establish impact reporting functions and apply for certifications. For instance, 40 percent of European

social enterprises report not having measured the impact they are making at all; and only 20 percent report using an existing certification system (Euclid Network, 2022).

Conclusion

Social entrepreneurship is more than a trend; it is a transformative approach to addressing some of the world's most pressing social and environmental challenges. By merging the innovative capacity of business with the altruistic goals of the social sector, social enterprises are uniquely positioned to generate significant positive impacts globally. They achieve impact through serving marginalized communities, employing individuals who would not otherwise have access to jobs, and creating socially beneficial products and services. But also by shifting broader societal systems, often serving as catalysts for policy reform, cultural change and economic development.

The potential of social entrepreneurship is vast. Yet, unlocking its full promise requires a supportive ecosystem. Governments, international bodies and the private sector must work collaboratively to create tailor-made enabling environments – including regulatory, legal and measurement frameworks, as well as financing mechanisms, networks and training programmes – that recognize and support social entrepreneurs and their ventures. Incorporating and re-purposing institutions and innovation support mechanisms originally developed for public science and corporate innovation should be part of this process.

At the same time, the onus for change is not confined to the actors that surround social entrepreneurs. There is scope for social entrepreneurs themselves to more actively drive innovation within their enterprises. This can be done through dedicated attention to key activities such as R&D, process innovation, and patenting and trademarking. But it also requires concrete action to embed social enterprises within existing innovation ecosystems; for instance, by tapping existing sources of scientific and technological knowledge, as well as venture capital, R&D tax credits and other innovation finance tools and by collaborating with universities, public research organizations and other entrepreneurs.

Together, by investing in supportive policies, education, infrastructure and financing, and by encouraging social entrepreneurs to engage with existing innovation ecosystems, we can collectively unlock the full potential of social entrepreneurship to drive sustainable development on a global scale.

GII 2024 Economy profiles
The following tables
provide detailed profiles for
133 economies.

Source: Global Innovation Index Database, WIPO, 2024.

How to read the Economy profiles

The following tables provide detailed profiles for each of the 133 economies in the *Global Innovation Index 2024*. They are composed of four sections.

1 Overall GII Rank: 84

2 Key Metrics: Innovation Input rank, Innovation Output rank, Income group, Region, Population (millions), GDP (billion USD), GDP per capita (USD PPP)

3 Pillars: Institutions, Business environment, Human capital and research, Market sophistication

4 Indicators: Knowledge workers, Knowledge absorption, Knowledge diffusion, Knowledge impact, Knowledge creation, Creative outputs

1. At the top is the overall Global Innovation Index (GII) rank for each economy.

2. Next are the key metrics for each profile which provide the specific context for that particular economy: namely, its Innovation Input and Output Sub-Index rankings, the income group to which the economy belongs, its geographical region, population in millions, GDP in billion USD purchasing power parity (PPP), and, lastly, GDP per capita in USD PPP.

Because economies may either drop in or out of the GII, and due to adjustments made to the GII framework every year and other technical factors unrelated to actual performance (missing data, updates of data, and so on), the GII rankings are not directly comparable between one year and another. Appendix I provides further details.

The Innovation Input Sub-Index rank is computed based on a simple average of the scores in the first five pillars, while the Innovation Output Sub-Index rank is computed based on a simple average of the scores in the last two pillars. Scores are normalized values falling within the 0–100 range.

3. Pillars are identified by an illustrative icon, sub-pillars by two-digit and indicators by three-digit numbers. For example, under the pillar Institutions is the sub-pillar 1.3, Business environment, under which is indicator 1.3.2, Entrepreneurship policies and culture.

The GII 2024 includes 78 indicators in total and three types of data. Composite (or index) indicators are identified with an asterisk (*), survey questions with a dagger (†). The remaining indicators are all hard data series.

As far as possible, we have provided the (scaled/unscaled) value of the indicators rather than the score. Indicators based on survey responses (five indicators) or an index (10 indicators) are always reported as scores, while eight of the 63 hard data indicators are likewise reported as scores. This means that, overall, 55 out of 78 indicators are reported as values in the economy profiles.

When data are either unavailable or out of date, “n/a” is used, with a cutoff year of 2014. To the right of an indicator name, a clock symbol ⌚ is used when the available economy data are older than the base year. For information on data exceptions and limitations and a detailed

explanation of the GII framework, see Appendix I. For further details on indicator sources and definitions, see Appendix III.

4. On the far right of each column, the strengths of an economy are indicated by a solid circle ● and weaknesses by a hollow circle ○. The strengths of an economy within its income group are indicated by a solid diamond ◆ and weaknesses by a hollow diamond ◇. The exceptions to this are the top 25 high-income economies, whose strengths and weaknesses are instead computed within the top 25 group.

Rankings of 1, 2 and 3 are highlighted as an economy's strengths, except in particular instances at the sub-pillar level, when the desired data minimum coverage (DMC) is unmet for that sub-pillar. For the remaining indicators, the strengths and weaknesses of a specific economy are based on the percentage of economies whose scores fall either above or below its own score (i.e., percentile ranks) and where the data is no older than the indicator mode minus 5 years. In practice, this means that for indicators with a data year mode of 2023, an economy's data year must date from 2018 or be more recent in order to classify as a strength or weakness.

For any given economy, strengths ● are those scores with percentile ranks greater than the 10th largest percentile rank among the 78 indicators for that economy.

For that same economy, weaknesses ○ are those scores with percentile ranks lower than the 10th smallest percentile rank among the 78 indicators for that economy.

Similarly, for any given economy, income group strengths ◆ are those scores above the income group average plus the standard deviation within that group.

For that same economy, income group weaknesses ◇ are those scores below the income group average minus the standard deviation within that group.

In addition, economies with a sub-pillar that does not meet the DMC requirement will show the score for that sub-pillar within square brackets. Those with more than one such sub-pillar also include the ranks for that pillar within square brackets. For these pillars and sub-pillars, neither strengths nor weaknesses are signaled.

The *Global Innovation Index 2024* (GII) takes the pulse of innovation against a background of steady but slow global economic growth, shrinking innovation finance and sluggish productivity.

Tracking the most recent global innovation trends, the GII finds that innovation investments have slowed in 2023, making the outlook for 2024 and 2025 more uncertain than ever. Yet, the picture is not entirely bleak. Technological progress and adoption continue unabated in fields as diverse as supercomputing, connectivity, health and green technologies.

The thematic focus of the 2024 report is social entrepreneurship. It looks at how a flurry of new ventures are finding innovative solutions directly addressing critical societal issues. Examples drawn from around the world showcase successful examples of social entrepreneurship, helping guide innovation policymakers and support schemes to better scale social entrepreneurship ventures for maximum systemic impact.

Core to its economic and social development mission, the GII 2024 reveals who is leading globally in innovation, ranking the innovation performance of 133 economies and highlighting their strengths and weaknesses. Governments around the world use the GII to benchmark innovation performance and improve innovation policy and its impact.

The underlying 133 GII economy profiles can be accessed at www.wipo.int/gii-ranking.

The full report can be downloaded at www.wipo.int/global_innovation_index.
